# Dominion Oxygen is ready for you any time, at any place, in any quantity

THE Dominion Oxygen Company, Limited, has fulfilled its promise to Canadian Industry.

Already four of the modern distributing centers called for in its building and distribution program are in operation, and Canadian-made oxygen of the highest and most uniform purity is available in sufficient quantity to supply the entire Dominion.

Co-ordination of production and distribution has made it possible to ship orders on the day of their receipt—insuring prompt delivery to all parts of industrial Canada.

An exceptionally light and strong type of cylinder has been adopted which greatly reduces freightage and handling charges, while insuring a gas content sufficient to make constant reorders unnecessary.

Unfailing and uniform purity, always reliable immediate service, a conveniently handled cylinder of large gas capacity and a liberal policy of cylinder loans make Dominion Oxygen and Dominion Oxygen Service the choice of Canadian oxygen users.

DOMINION OXYGEN COMPANY LIMITED

# Open a Bank Account in Canada

The present abnormal exchange situation between Canada and the United States is affecting trade relations between the two countries. Exporters in the United States can meet this by opening Bank Accounts in Canada.

**This Bank has 720 Branches, of which 620 are located in Canada from the Atlantic to the Pacific Coast. Write for a complete list of Branches and for terms respecting a Canadian account.**

# THE ROYAL BANK OF CANADA

**Capital and Reserves $40,000,000** **Total Resources $595,000,000**

***Head Office:*** **MONTREAL**

# PACKINGS

Take packings—rod and sheet—away from the industries, and even the most inexperienced knows what would happen.

With the operation of practically all kinds of plants, factories, mills, etc., so utterly dependent on rod and sheet packings to allow proper operation, why use any but thoroughly reliable and well-known products?

## DANIEL'S P. P. P. ROD PACKING

Probably the best known rod packing on the market. Unequalled for the packing against steam, water, air, ammonia, and other fluids.

Many practical tests by experienced engineers under various conditions have clearly demonstrated that P.P.P. is the most economical rod packing to use. Its long life is remarkable, its ability to create a saving in the fuel bill is well known.

***"The Story of Some Friction Test"***

is a booklet that should be in the hands of everyone who has anything to do with rod packing, whether buyer or user.

## EBONITE SHEET PACKING

Used exclusively in many of the largest power houses, factories, and machine shops, for high pressures, super-heated steam, hot water, ammonia, oils and acids and all other kinds of joints requiring packing.

EBONITE will hold a vibrating joint absolutely tight, and where there is a varying expansion or contraction of the pipes EBONITE is especially desirable.

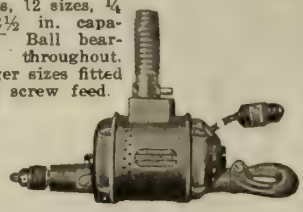
## "ECONOMY"
### Parallel Ruler Attachment



A simple arrangement which does not interfere with work on the drafting board in any way. It does away entirely with the clumsy "T" square and the necessity of watching to see that it is always against the edge of the board.
Invaluable to draftsmen, absolutely accurate, quickly lifted clear of board for changing drawings.

## Over seven pages printed here each week for your convenience

Consult this Buyers' Directory when you want the names of reliable makers of machine tools, parts, steel, in fact any equipment you may need.

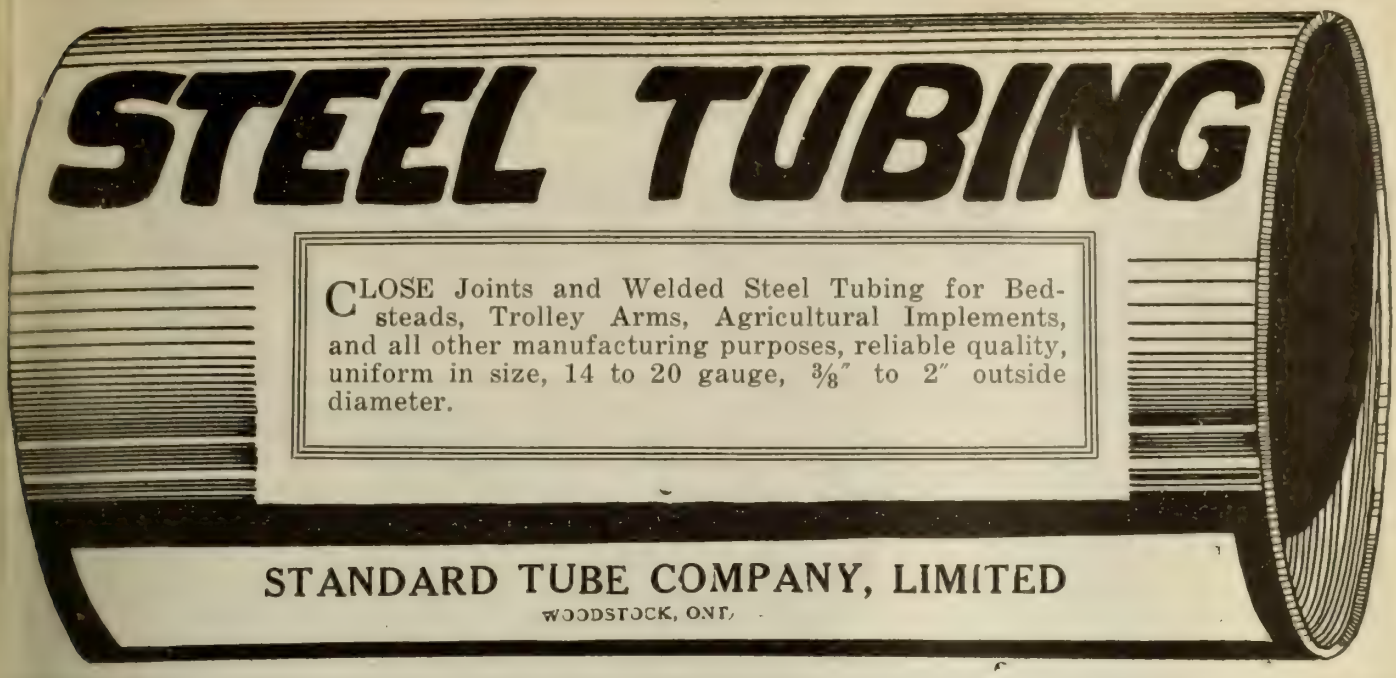
THE

TRADE K–T MARK

FOUNDRY

GALT, ONT.

# Do Your Castings Cost Too Much?

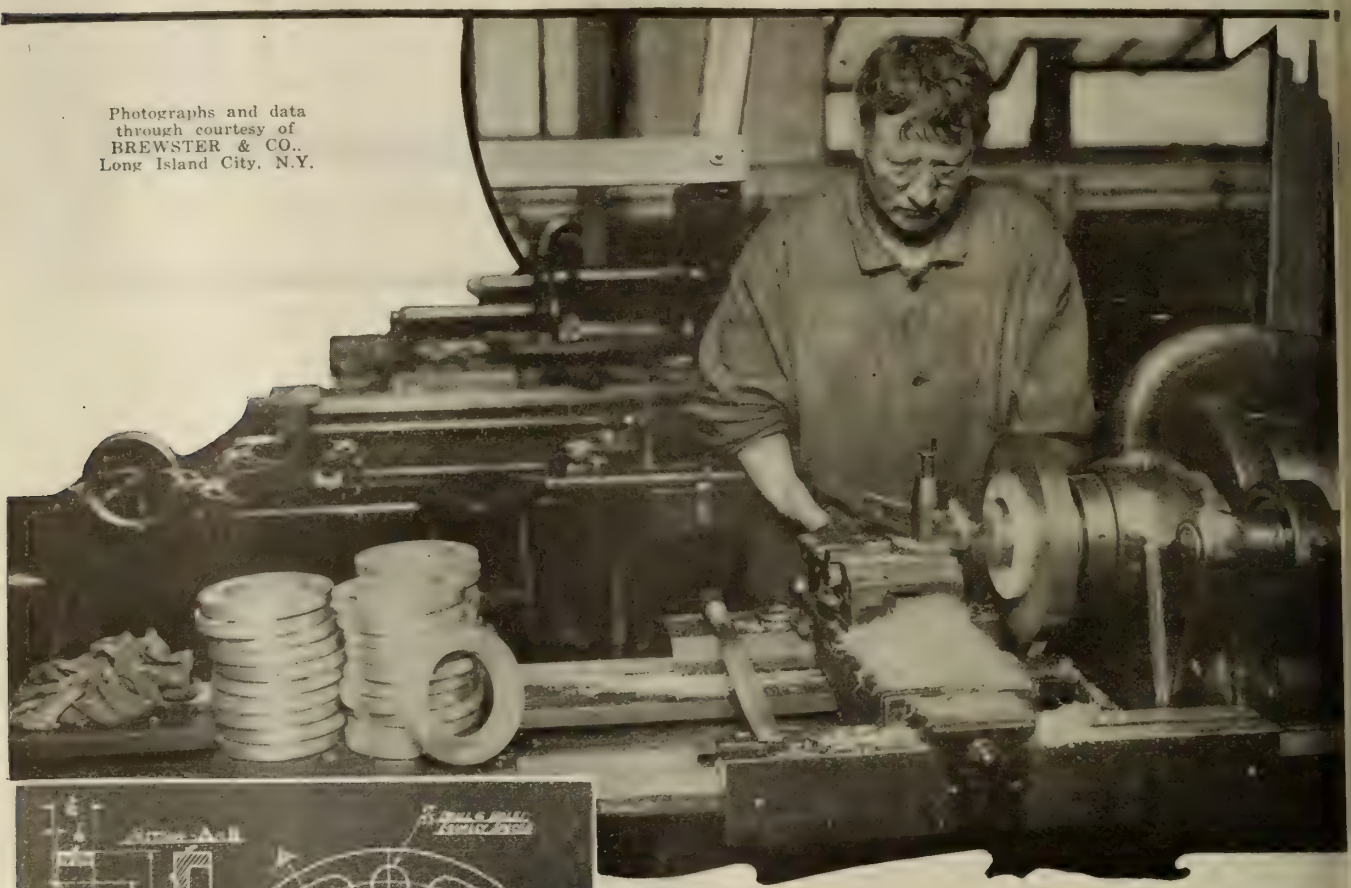


A rearrangement of your patterns might cut their cost 25 per cent.; a different method of molding them might double your production at no increase in molding cost. We can advise you and we have expert metal and wood patternmakers who are able to make any changes that may commend themselves to you.

## If you need some new Patterns

send us a sample, blueprint or sketch, and ask for our advice. It won't cost you anything. If our advice is good and commends itself to you, it is only fair to assume that our work will be equally satisfactory, and we need the work as badly as you need the patterns.

We are in a position to do turning, boring, drilling or other semi-finishing operations on castings supplied by us. Ask us.



***We have for our and your requirements, a large stock of assorted White Iron Stars, suitable for light agricultural to medium weight machinery castings, while they last, at 8 cents per lb. F. O. B. Galt.***

# HENDEY

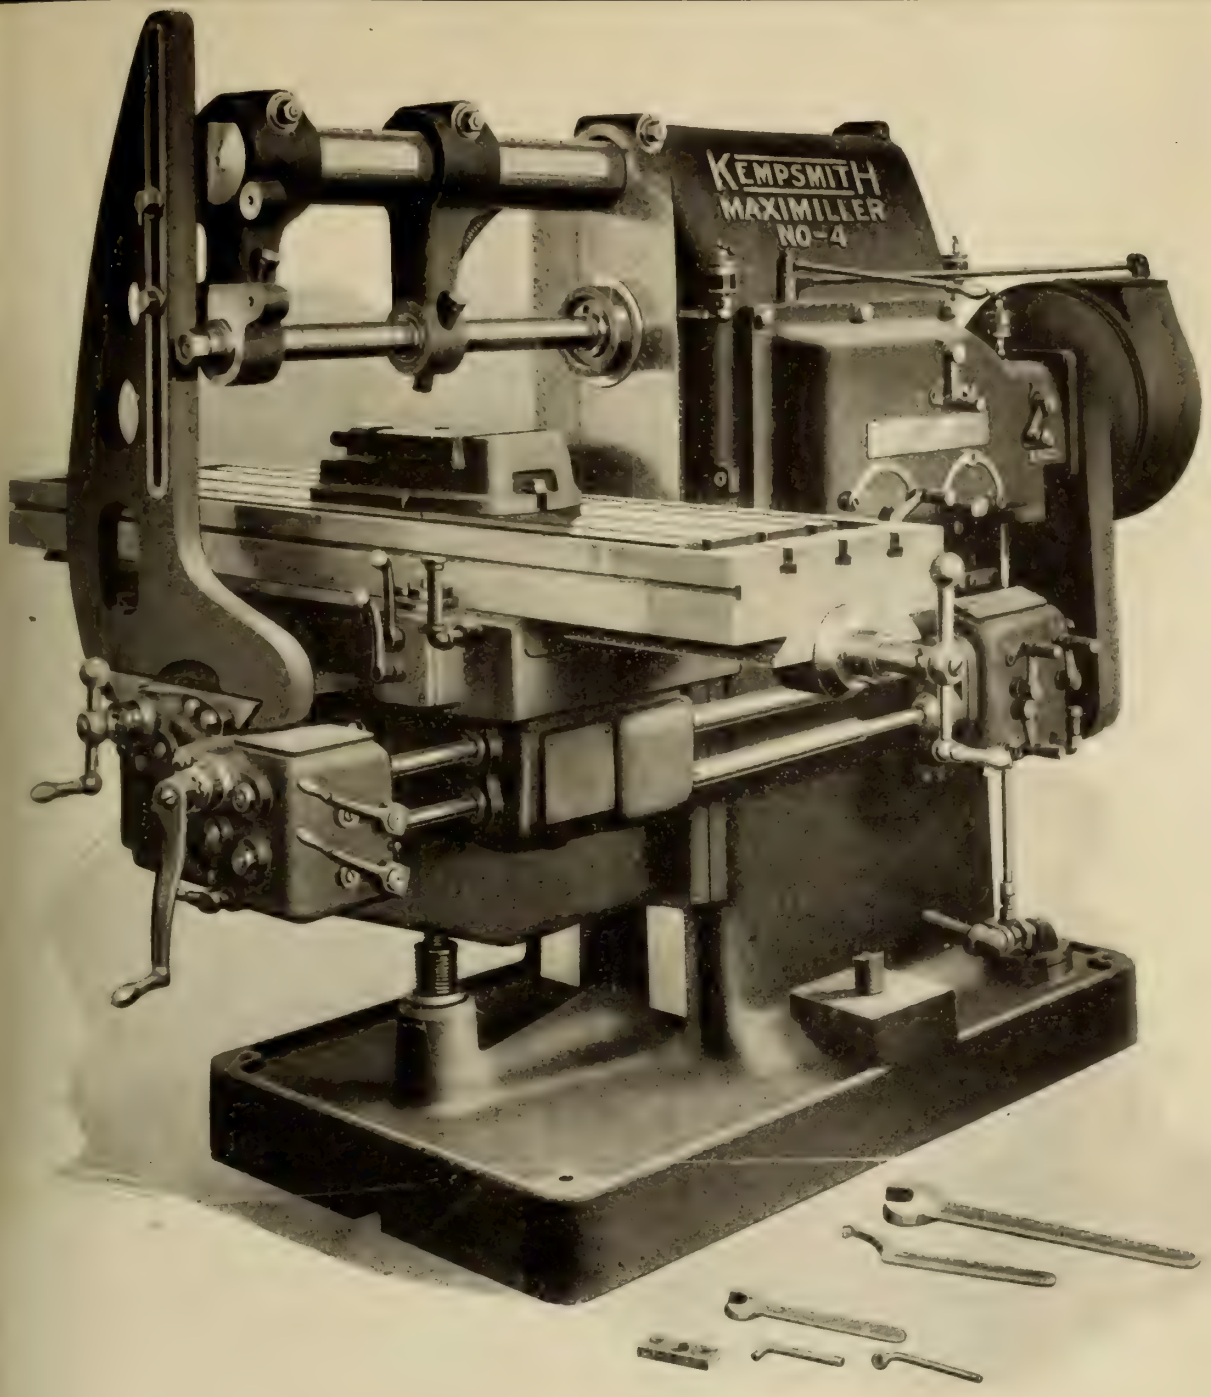
Photographs and data through courtesy of BREWSTER & CO., Long Island City, N.Y.

Every executive in America, especially in the automotive field where production problems are acute, should have a set of Hendey Catalogs for his guidance in specifying or ordering machine tool equipment.

## bore, face, and bore snap on reverse side—

***Fast Production***
***With Accuracy***
***IMPERATIVE***

CLUTCH SPACERS at the Brewster plant present no production problem simply because—you'll find Hendeys there. Which is merely another way of saying that fast production with the consistent accuracy necessary on this class of work is only a question of choosing a lathe of proved worth, of present-day efficiency.



If considering lathes, consider Hendeys. It's the safe, sure, proved-in-service line. Know this line and you know lathes.

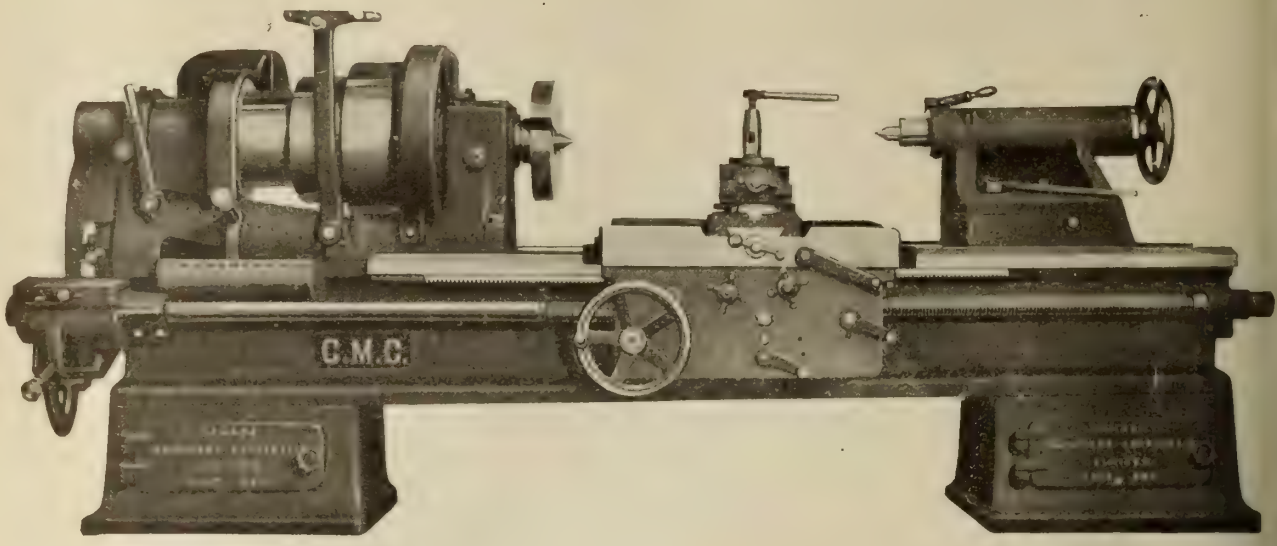
**LATHES — SHAPERS — MILLER**

# KEMPSMITH No. 4 Plain Maximiller

**Single Pulley Drive**

**Equipment.**—1¾-inch arbor, two arbor supports, brace, No. 4 Plain Vise and all necessary crank-handles, wrenches, and accessories as shown.



The Kempsmith No. 4 Plain Maximiller has been designed in recognition of the growing demand for a heavier and more powerful machine than the usual cone type miller. It is the product of some twelve years' experimentation by an experienced and thoroughly seasoned organization. In all features of general design, such as weight, rigidity, convenience of operation and efficiency in production we offer this machine as maximum milling machine of similar rating.

No expense has been spared to incorporate the very highest class of materials obtainable. All gearing stock is purchased to exact chemical analysis and is scientifically heat-treated for the particular use to which it is put. Much of the shafting, especially that in the speed train, is also heat-treated alloy steel.

## THE GEO. F. FOSS MACHINERY & SUPPLY CO., LIMITED

305 St. James Street - MONTREAL

# *Watch the C.M.C. 26" Engine Lathe in Action*

Notice the extra wide cones on the headstock. Wide cones mean more power and more power means greater production and larger profits. The special belt shifter placed on the headstock in front of the cones prevents any danger of injury to the operator when changing belts from one step to another, this shifter being fitted with a self-locking pin which centers the belt over each cone as desired. A corresponding shifter on the countershaft completes this safety first attachment.

# SMALL TOOLS

## Pratt & Whitney Adjustable Blade Reamers

These reamers have eccentric relief and can be set to size without regrinding. They are unexcelled for design and simplicity and ease of adjustment.

The eccentrically relieved blades are stronger than others, do not chatter, and produce a smoother hole. The hand, shell and fluted chucking reamers have interchangeable nuts, screws and wrenches. The bottom of a hole can readily be faced.

By a simple adjustment of the blades the reamer can easily be set to size, without regrinding.

*Prompt service is assured at our nearest store, where P. & W. Small Tools are carried in stock for immediate delivery. Place your order there to-day.*

H.W. PETRIE LIMITED TORONTO

**Canada's Dependable Machinery and Supply House**

There are two things of vital importance to you when ordering machinery or supplies.

First, you must be assured of getting what you order delivered when you want it.

Second, you must be assured of the quality of the product and the price.

From our immense stock we are always able to fill your needs, and our excellent shipping assures prompt deliveries.

We handle only high-grade machinery and supplies and our exclusive buying and selling connections enable us to sell our lines at the most reasonable prices.

For over half a century the name of **Petrie** has been to the front in the machinery realm of Canada. It is regarded as synonymous with machinery, quality and service. How can we serve you?

**The Coventry Self-Opening Die Head is made in seven sizes —5-16 to 3 in.**

**A complete range of dies covering U. S., Ltd., S. A. E., A. S. M. E., Briggs' Pipe, and Whitworth Threads is carried in our Toronto Stock.**

# The Leading Features of the Coventry Self-Opening Die Head

*Accurate Pitch* produced by the guiding action of straight-cut dies.

*Adjustability* providing fine regulation of diameter, combined with wide variation in size cut by each set of dies.

*Clean and Smooth Threads* for the reason that chasers have ample cutting clearance.

*Parallel Threads* owing to the very efficient support for the dies.

*Cuts Right and Left Hand* threads equally well.

*Hollow Shank*, permitting unlimited lengths to be threaded.

*Compactness*, permitting the Die Head to be used on Turret rests, in which the height of the tool holes above the slide is limited.

*Roughing and Finishing Attachment* for obtaining unusual accuracy and finish on large diameters and on material of an exacting nature.

Ease of grinding the dies. The Coventry Die Grinding Fixture permits the dies being ground together to definite angles which are uniform for all sizes of dies and die heads.

A complete range of die heads and dies is carried in Toronto stock, ensuring prompt service.

# A Thousand Things You Ought to Know

EVERY day in your work you get up against new problems—sometimes it is only some old 'sticker' coming in a new way. Just the same though it takes a lot of time to figure them out. **Don't do it.** Here's everything worked out for you. Every problem, big or little, that you will meet in a day's work. Hundreds of new ideas and better ways of doing things. Hundreds of ways the other fellows are making money. Hundreds of ways you can make more out of the same work you are doing now.

The old days of hit-or-miss experience are passed. You have got to know if you want to keep in the running now. A little of your spare time and a set of Machine Shop Practice will put you 'way head of the rest. See our FREE trial offer and easy payment plan below.

## Machine Shop Practice

Six great big volumes bound in genuine American Morocco with 2300 pages and more than 2500 blueprints, plans, pictures and diagrams. It is the newest, most complete, most practical work of its kind ever published. Eighteen well known experts prepared these great books, gathering the material from hundreds of different sources. Every man in the shop and on the job should have them. Over 25,000 sets have been sold.

### FREE Examination
### 10 Months To Pay

Send the coupon for these great Machine Shop Books TO-DAY. You can't afford to be without them and you don't take any risk at all. The coupon brings the whole set by express collect for a week's free examination. Use the books a week and send them back at our expense if they don't please you. If you like them, send us only $2.80 and $3.00 each month until $24.80 is paid. If you prefer to pay cash with order, send only $22.30. The return privilege holds good just the same. Send the coupon NOW and get the consulting membership free. This part of the offer will be withdrawn when the membership is filled. Remember—sending for the books does not obligate you to buy.

### Consult Our Experts

With every set of these books we give free a one year consulting membership in our society. This entitles you to consult our engineers and experts on any shop proposition, any time, for one year. Write often—ask as many questions as you like.

# THE JOHNSON FRICTION CLUTCH

## IF YOU BUILD MACHINERY

you are anxious to put into your product every refinement which will add to its efficiency—which will make it serve your customer longer and more satisfactorily.

One of the most important features of any machine is its clutches. No single item adds more to machine performance than a good clutch, and nothing can be a greater source of annoyance than a poor one.

Play safe and equip with Johnson Clutches.

*Write for Our Yellow Catalog and Booklet "Clutches as Applied to Machine Building"*

## IF YOU USE MACHINERY

you are looking for the machine with the highest rate of production, the smallest amount of lost time, and the longest life. In all probability you will find that machine equipped with a Johnson Clutch, for the Johnson Clutch not only gives best service, but adds greatly to the convenience and speed of operation.

Look for it on the machine you buy, and to be consistent equip your plant transmission in the same way.

# Robertson Process Metal

## *For Permanent Replacement*

*Permanent roofs at minimum cost! Siding that lasts for years!* That's what you get in Robertson Process Metal. The illustrated sample shows *why*. A specially annealed steel core is covered with (a) Asphalt (b) Asbestos (c) Waterproofing. The inherent qualities of these protective coatings insure a long life of usefulness.

Robertson Process Metal assures quick replacement of old, worn-out roofs and siding. It can be erected speedily and economically. The work can be accomplished without interruption to plant operation. It is unaffected by salt sea air, moisture or strong acid and alkaline fumes. It makes frequent painting an unnecessary expense. It saves on *first cost* and *maintenance cost*.

If your factory roofs need replacement, use Robertson Process Metal for permanence and economy. For the same reasons, use it for other building purposes. A sample like that shown will be sent you upon request, together with interesting literature. Write for them. You incur no obligation.

*If interested tear out this page and place with letters to be answered*

*Showing installation of Skinner Bros. (Baetz Patent) Heaters in foundry of Best Foundry Co., Bedford, Ohio. Note extensive area served.*

# Heat Your Plant at least cost

The Skinner Bros. (Baetz Patent) Heating System provides a constant and uniform distribution of heat, at less cost than any known system now in use.

As no distribution pipes or ducts are required, installation cost is 15 to 50% less than any other system. Power consumption is only 20% of the capacity of power units supplied with the average installation. Maintenance costs are lower because of the compactness and centralized design of the heating coil. No special foundation required other than provided by ordinary floor construction. Requires less floor space than any known system, and is easily installed by common labor. Is portable in the fullest sense of the word and can therefore be easily relocated in any part of the plant.

The Baetz principle follows natural laws in every case and is therefore positive and simple in its heating. Read the brief description at the left, under the heading "Mechanical Features."

## *Mechanical Features*

The Skinner Bros. (Baetz Patent) Heating System consists essentially of a large steam pipe coil compactly mounted above a centrifugal fan-wheel, both housed as a single unit within a heavy structural and sheet-steel casing.

Either exhaust or live steam (of high or low pressure) is conducted through the coil, and the cool air near the floor level, or from the outside, is exhausted by the fan and impelled around and through the various coil sections. The air, after thus being warmed, is discharged at low velocity through the outlet hood into the open building space. No galvanized iron ducts or pipes are used for air distribution, and as the air is not discharged under high pressure, it does not disturb floor dust nor create uncomfortable drafts.

The warm air is not confined to a zone immediately surrounding the heaters, but the heat penetrates to the furthest corners of the open area and maintains an even, comfortable average temperature at all points.

Made in six styles and sizes. Where no steam plant is available, we supply our direct-fired type DF, in two styles and sizes.

Operated by any power available — motor, either belted or direct, engine or line shafting.

## *Sold Under Positive Guarantee*

Send for pamphlet No. 50, describing various uses, and for No. 80, giving list of installations. If possible, send blue print or pencil dimension sketch of building to be heated and state steam pressure available to enable our Engineering Department to quote on the proper size required.

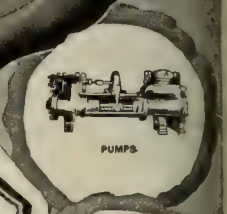
# FAIRBANKS-MORSE

## The Power behind the Wheels of Industry

POWER—mechanical force—harnessed, transmitted and utilized in its most economical phase—is always associated with The Canadian Fairbanks-Morse Co., Limited, whenever the modern oil engine is mentioned.

Wherever boats ply the waters the Fairbanks-Morse C-O engine is found. In the fishing boat the sturdy Type "M" does it duty. A quarter of a million farmers are helping to increase the world's supply of food with the Type "Z". In hundreds of the country's great industrial plants the powerful Fairbanks-Morse Type "Y" is furnishing the power that is speeding up production, keeping down costs, and helping the world of commerce right itself.

Saving time and labor, lowering operation cost, and giving a service that is as near 100% as possible is the record of Fairbanks-Morse engines, for behind each Fairbanks-Morse engine is that 100% quality standard on which the Fairbanks-Morse institution is founded.



Back of every Fairbanks-Morse oil engine is the service of our experts. Avail yourself of this quality and this service. Concentrate your buying and make the Canadian Fairbanks-Morse catalogue your guide.

# Making One Thousand Milling Machine Saddles

## Equipment Necessary to Produce One Thousand Saddles Every Year. Pattern Work is Taken Up, Also Various Machining Operations, Cost of Machine Tools and Other Vital Points.

By DONALD A. HAMPSON

N the November 11th issue of Canadian Machinery we published an article by John S. Watts, dealing ith the manufacture of 1,000 milling achine saddles per year. This article reated considerable interest and diver- ity of opinion. The present article ives another reader's views of the prob- m, and the information contained here- should be carefully read, then filed or future reference. Mr. Hampson, he present author, commences his rticle as follows:

To every production problem there are wo or more answers. Given the design, the problem starts with the pattern, goes from there to the foundry, stops briefly at the tool room, then broadens out into a machine shop job of magnitude and precision.

There are three hundred working days in the year, but every production man knows that in ordinary life it is not safe to count on more than ninety per cent. of the "on paper" production per unit of time, and no executive wants to skin through on a schedule that makes no allowance for the unforeseen and the inevitable; therefore, we will map out a schedule on a basis of 250 working days per year, which calls for a production of four completed saddles a day.

Machine shop jobs may be done in several different ways. Speaking broadly, none but an egotist would say that his way was the best, for according to conditions of equipment, finance, and labor, what might be good practice in one plant would be impractical in another. But each plant, in adopting methods suited to its peculiar conditions, might turn out the same grade of accurate work at a profit to itself, and, if each obtains the same production, then each may be said to have adopted the best practice

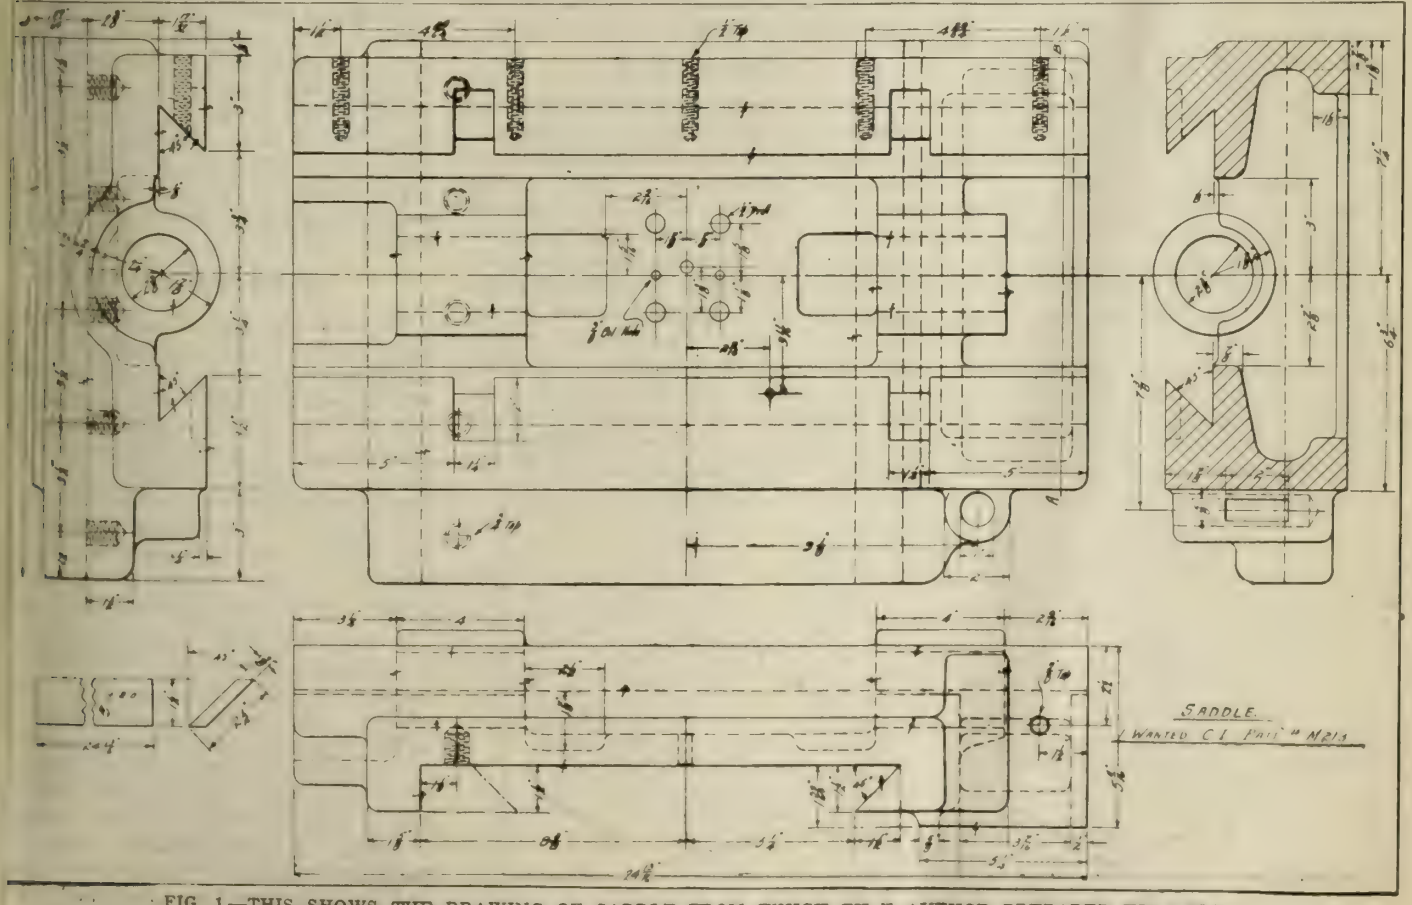

FIG. 1.—THIS SHOWS THE DRAWING OF SADDLE FROM WHICH TH E AUTHOR PREPARED HIS DATA.

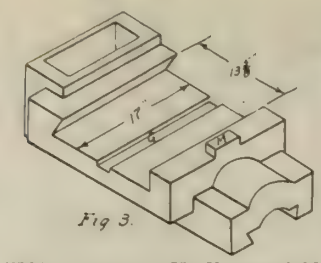
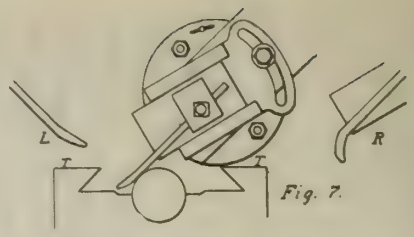


for itself. The problem varies also in whether a given part is to be made in an existing plant on tools already there, or whether the plant is newly tooled for just this piece; the former is generally the case.



### Planer Work

Planer work forms the foundation upon which nearly all machinery is built, particularly is this true of machine tools. The most accurate planers and the best men are considered essential to the production of the faces, slides, and vees of all machine tools. In the face of keen milling machine competition, planer work has lost but little of its prestige—at least, for finishing cuts. The fault to be found with milling machine work comes from (1) spring of the mandrel, (2) cutter passing on and off the work surface, (3) improper grinding of cutter or inaccuracy of spindle, which makes a setting from a gage unreliable. If the miller is stopped during a cut, the first two mentioned faults may appear as a mark deeper than the rest of the machined surface, condemning it as a first class piece of work.

However, the scarcity of skilled mechanics, competition, and the lessons taught by the manufacture of automobiles, all distract the production man away from planer work. There is a "standard" method of doing high class planer work, and this will be considered first as a means of getting out the milling machine saddles. Then, a method by which unskilled men can do a goodly part of the work on simple machines will be taken up—a method in which the work is resolved into simple, single operations within the capabilities of low grade labor. The latter method will be of greater interest because of the present prices of machine tools—new planers of the sizes needed for this job costing from $4,000 to $8,000, and for a production of four saddles a day not less than three planers are required.

Figure 2 is a perspective of the miller saddle right side up. No matter how complete line drawings may be, or how well able one may be to visualize the thing they represent, a drawing in perspective or a free hand sketch will bring up points that may be wholly overlooked in long study of the original drawings. Perspectives are of invaluable assistance to those who design tools and fixtures for manufacturing.

FIGS 3 AND 7—ILLUSTRATING A FEW OF THE AUTHOR'S SUGGESTIONS.

Returning to the first step in production—that of pattern-making. It is necessary to get out one wood pattern from which may be obtained castings in aluminum which are to be machined all over to form permanent patterns that the foundry will use for production. Even if they would stand up under long daily abuse, wood patterns would soon lose their shape so that the machine shop would be seriously retarded; good castings are hard to get under any conditions, and the best of patterns should be provided to leave no source of criticism open on that point. Rejected castings, both foundry and machine shop losses, may run from one-half to five per cent. of the total, and for these it will be necessary to make others, so that it will be required to mould four saddles every day with an additional one about once a week. If the plant's foundry uses moulding machines it will be easy to exceed this production—if all the moulding is hand work, and that is well organized, one pattern will suffice, while, if the foundry organization is more or less disrupted, two patterns will be required.

### Pattern Work

Figure 4 shows how the pattern, or patterns, will look. It is cast hollow to save weight and expense and is machined all over on its exterior surfaces, with a slight draft on the vertical faces, making the side which is uppermost in Fig. 4 the smaller. This drawing shows the pattern upside down for the sake of clearness. With the exception of the guides that fit the knee of the milling machine, the entire mould is made in the drag. Four dry sand cores are used to form the undercuts and various irregular parts, and these are shown as part of the pattern: Cores 1 and 2 are made in the same box and their location is made easier by the two prints which are extensions of the cut-outs in the top of the casting. These two cores are placed first. Core 3 makes both of the feed screw holes as well as a portion of the center floor. It is made in one piece to better align the holes. Core 4 is the last one placed before the mould is closed. This core forms the space for the gear driving parts. So made, the pattern is an easy one to draw, and the cores all lie on solid sand. The preliminary wood pattern is a duplicate of the one shown, with the added allowances for finishing and contraction.

The foundry work sholud be carried on some weeks ahead of the machining, both to avoid any possible delays to the shop, and to allow the castings to season themselves a trifle. Each casting must be thoroughly cleaned and inspected before it is shipped in to the shop. If there is no sand blast available, the castings should be run for a time in a tumbling barrel. Where a foundry has a sand blast, it has compressed air, and this may be utilized for pneumatic chipping with a gratifying saving over hand work. Before getting into production, sample castings are made, to determine if everything is all right, and there is just the right allowance for finishing up. The locating points for the first operations are checked up at this time, to make finally sure that all the first workman has to do is to "clamp her down and start a cut."

### The All-Planer Method

Through the use of proper fixtures, by simplifying the movements, and by curtailing some of the universal features of a planer, the saddles may be planed in half the time, and that with only an intelligent laborer properly instructed, instead of a skilled machinist. Fig. 5 illustrates the fixtures for the first operation, which is rough planing the under side. The scheduled production, being four per day, the various operations in multiple should be in units of four each.

A cast iron base plate P, about 90 in. in length, is arranged to fasten to the planer table and to take four of the saddles laid crosswise. One saddle is shown in position and near it the fixtures for another. It is far better to use a false work table, for thus the constant sliding (and peining) of rough castings is put on a more accessible part, and the slow process of sliding bolts along and cleaning long slots is avoided. And

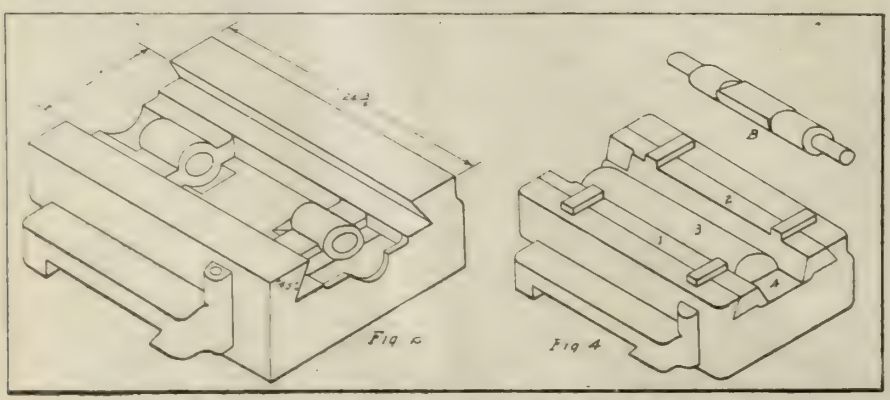


FIG. 2.—THE PATTERN, AS THE AUTHOR WOULD HAVE IT.

bolt slots rarely line up well for a string of castings.

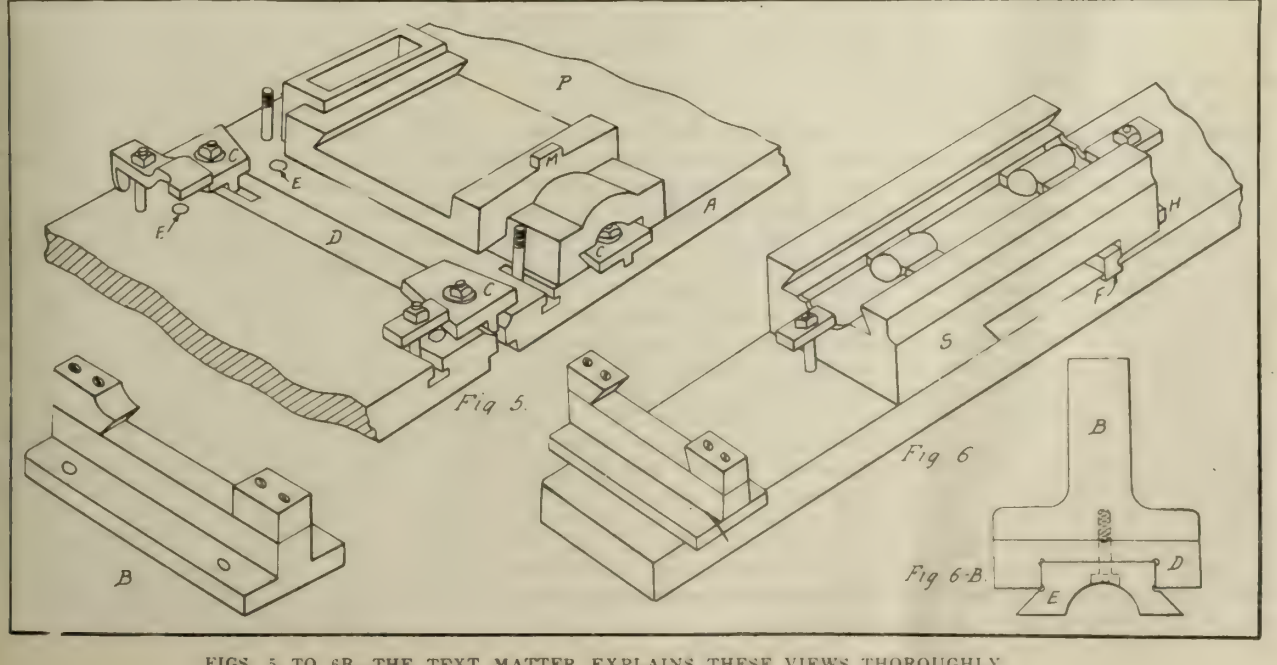
Returning to the drawing. There are four shallow grooves cast at right angles to the direction of the cut. These not only assist in levelling up, they afford clearance for the two hubs which are higher than the straight faces of the saddle. The castings are located from the most important faces, i.e., the miller) table vees. The locating blocks C carry steel castings with machined faces guided in short machined slots in the base P. There are two symmetrically tapered sides, and as these pieces are pushed towards each other, they accurately locate the saddle at points on its greatest length. When in position, the blocks are tightened, becoming stops for the work as well. Four clamps hold the saddles down—all but the end clamps draw on two saddles at once.

When a set of castings has been finished, the nuts are loosened and the nine bolts alongside A are slid out of their slots. A slight movement, and the castings are free of the rear clamps and may then be picked up with a hoist, or pulled further forward on shop trucks for delivery elsewhere. Cleaning the surface of the base plate P is almost nothing, for the castings are brushed off before the bolts are loosened, and there is very little dirt to fall in the short slots on the operator's side. The next set of saddles should be put on and clamped in half an hour, as an outside figure.

All the nuts on the fixture are of the same size and hardened, and the screw in the tool block should be changed to the same size. This makes one wrench the only tool the workman needs, aside from the gauge, and he should be forbidden the use of anything else. There are four plugs of hard steel—E E—set in the plate P under each saddle and these are a full thirty-second above the general surface, not enough to interfere with handling the castings, but high enough to serve as leveling spots, and it is on these spots only that any packing up is done, either with slips of paper or tin.

For this first operation a 30 x 30 x 8 ft. single head planer will be required. This will cost around $4,000. The fixtures described can be made for a minimum of $100, though work of this kind varies widely in cost under different wage scales and according to the amount, or absence of, system in the particular shop. Two sets of saddles—eight pieces—should be roughed out per day with this equipment.

The roughing operation finishes all the surfaces within one sixty-fourth of an inch. Fig 5 B shows the tool setting gauge which is clamped to the front end of the plate P. This gauge is a grey iron casting whose top face forms one of the setting surfaces and on which are screwed and dowelled the blocks for gauging the 45 deg. and the 90 deg. faces as well as the extreme height. The tools are set to the different faces of the gauge, using a paper feeler betweeen tool and gauge.



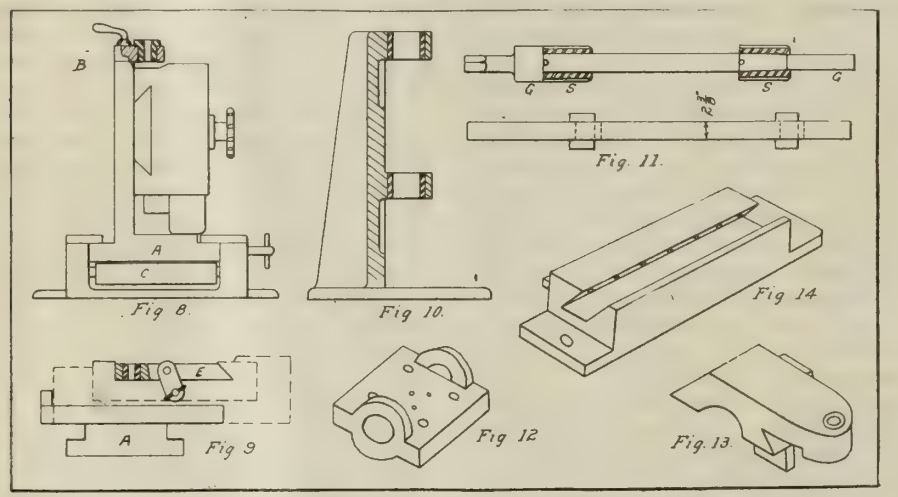
Three slight changes in the original design could be made to facilitate machining. The vertical surface of the saddle, marked S in Figs. 1 and 6, should be machined. It will aid materially in subsequent operations to do this, and it will add a degree of refinement to the assembled machine of which it becomes a part. A planer boss, M in Figs. 3 and 5, is of utmost importance in setting up the castings for several operations, and it would not detract from the finished piece to leave it after the work is done. Thirdly, a groove G in Fig. 3 will save time and tools in cutting, the broad flat under surface, if not permissible as a slight clearance on the finished piece, it will nevertheless save time if this is cast an inch wide and half or two-thirds depth.

### Second Operation

Fig. 6 details the layout for the second operation, that of the surfaces on which the table itself travels. Here again a false table for the planer is used, but this one is ridiculously simple, its top surface being broken by only five studs, four right angle bars F, and eight posts H, which carry safety set screws to keep the saddles against the bars F, in addition serving as spacers betweeen castings. A tool setting gauge is provided, of similar construction to that in Fig. 5.

This operation requires a 24 x 24 x 10 planer, preferably with two heads on the cross rail. Its cost will be about the same as the other planer. A narrower planer would do this work, but most of the shops prefer to pay for a little more width between housings with so long a table. The fixtures shown will cost $70 or more. They provide for four saddles in a string, and they should turn out two full loads a day. Setting up is very simple. The under side of the casting is planed, one end a hollow square and the other the spot M offering a three-point bearing that requires a minimum of packing up under it. There is a planed edge to go next to the bar F, and two safety set screws to hold it so in line, while laterally the castings are placed so the face S is "felt" even with the edge of the false table. Five clamps hold down the pieces. In case the suggestion to plane S is adopted, the castings have to be set overhanging the edge.

Workmen's gauges for the job are made up as shown at Fig. 6-B, consisting of a cast iron handle B and two hardened steel pieces, D and E, of such a shape that they may be readily ground on all important faces. A similar gauge



FIGS. 5 TO 6B THE TEXT MATTER EXPLAINS THESE VIEWS THOROUGHLY.

is made for checking the planing of the bottom surfaces of the saddle. The estimated cost of the two vee gauges and those of the tool setting is placed at $60.

Taking up the actual cutting of the top of the saddle, it is found that the screw bosses are rather in the way. However, this is not as bad as it seems, for there is width of clearance next them. Referring to Fig. 7, the planer head is set at 45 deg., and a taper dowel put in, so that the exact location is quickly found without depending on graduations. The clapper block is stripped of the usual tool fixtures and is provided with an extension for tool support which is slotted for the tool, and fitted with a single clamping screw. Tools, tipped with high speed steel and ground to gauge, are provided in duplicate, and these are ground on the top only, always maintaining the same shape. With this equipment, tool setting is not a matter of guess work, nor subject to the whims of the operator, hence the time has to use or loose pieces or unnecessary nuts to tighten, the greater is the production.

The saddles are now roughed out all over, if possible. This part of the work should be kept a month in advance of the rest, so that the castings may be given a chance to season. The best time for this is after the outer skin has been removed. A piece of this shape and weighing nearly 300 lbs. will not warp much, but even if it changes as much as a piece of paper, that little must be taken into account and the planer hand, in setting up for the finish cuts, must pack up closer than this.

Our two roughing planers are placed side by side, but facing in opposite direction with the operator's sides together. One man can then attend to both machines very nicely, though there will be times when a helper can be used to advantage in loading and unloading. This way it is possible to get eight complete saddles a day from two machines, one planer hand and a helper. There is a greater

FIGS. 8 TO 14 (INCLUSIVE)—SHOWING VARIOUS MINOR OPERATIONS.

is cut to a minimum and uniform results are secured.

Another point: With two heads on the rail, each may be left permanently set at its own 45 deg. angle, with the left head presenting its tool as seen at L, Fig. 7. It is unnecessary to swing the right hand head back to zero to plane the top faces T, for by having a tool as shown at R, the work may be done equally as well. In case no two head planer was available, much the same system would be followed. The slot in the clapper block would have to be in the middle, two holes for the 45 deg. locating pin would be provided, and the planer head stripped of the unnecessary bolts and nuts that have to do with the angular adjustments and the clearance swivel, leaving just the three shown. These three left, the tool post screw, the table shifting dogs, and the nuts on the table fixture, all use the one wrench. This latter principle should be followed throughout, for a careful study of workmen will prove that the fewer tools he

area to cut on the under side, but there is so much better chance to get at it, so it can be done as quickly as the top.

### Finish

Coming to the finishing cuts. Two more planers are required. If the shop were doing nothing but making one size of saddle, it might be possible to get along with just the two planers, though it is doubtful if the yearly production could be obtained by any method without a third planer part time. The chances are that more than one size of machine is being built, in which case it is better to keep planers for finishing alone. For finishing, it will pay to have two false tables or plates similar to those of Figs. 5 and 6. One will be identical with that of Fig. 6, the other will be like Fig. 5, but with a single cross piece taking the place of the two tapered blocks, the cross piece aligning the work and taking the thrust of the cut.

The tool setting gauges will be like those used for roughing out, and there will have to be another set of gauges for the vees. Finishing tools will be similar to the roughers but keener, and those for the V sides must have sharper points. Feeds will also be less. The drawing shows sharp corners, but it is safe to assume that the sharp male edges on both the table and the saddle can be taken off to a ⅛ inch flat. It it better so from every standpoint, and then the corners at the bottom of the V may show a slight fillet. Finish planing will take about a third longer than roughing, and it is safer to put one man on each planer, holding him strictly accountable for results.

### Minor Operations

A number of miscellaneous operations follow the planer work. There is probably more chance for ingenuity here than on the planer work. The work is mostly drilling and tapping. Except for the larger drill screw holes, it would be possible to do all of this drilling with an electric drill, and to tap by hand. This would avoid considerable jig expense and some handling of saddles on and off the drill press, but it would take longer to do the work. A radial drill or an upright drill of around 30-inch size will do the work. The writer prefers the upright drill because of its fixed center, and ease of operation.

Fig. 8 shows the jig for drilling and tapping the set screw holes. There is a base that bolts to the drill press table. It carries six rollers C, on which travels the right angle piece A, which is located by the pin at the right points according to the set screw spacing. The saddles are held upright by two hand clamps, and the drill guided by bushings in the removable piece B. After the holes are drilled, the drill is removed, a tap inserted, and the holes threaded as A is run back to the loading station. The drill press, of course, must have a tapping attachment. A quick change chuck should also be added.

Fig. 9 shows a similar operation for the bottom gib holes. Another casting A is made for the same base, runs on rollers, and is indexed the same way. Its upper portion is a short section of a V slide. The saddle is placed on this and needs no other fastening. A jig piece E carries drill bushings and is held in place by its fit and end stops, one of the latter swinging.

To bore the screw holes, the fixture in Fig. 10 is clamped to the table. A three or four lip twist drill is the simplest tool to clean out the hole ready for reaming (on cheap work, this would make a very fair hole in one operation). The saddle is located and fastened by simple parts, omitted for the sake of clearness on the drawing. The two tools shown in Fig. 11 finish the holes and ends. The upper one is the reamer built up of two shell reamers and a ground shaft. This could be used in the machine by changing bushings, but the

writer prefers this to be a line reamer, used by hand, cutting at S and S, and guided by the parts G and G running in blocks which fit the saddle vee. The other tool is a facing bar that is guided by the finished holes, and uses standard cutters that are changed for the reverse facing. A gauge for this must be made. It may be of heavy sheet metal, hardened and ground.

In the center of the saddle is a group of small holes that are best included in one jig as shown by Fig. 12. This is a cast iron block containing the seven bushings—it drops into the depression in that part of the saddle and is located by passing short pieces of shaft through the large holes into the counterbores shown.

A one inch pin is employed for the feed throw-off and the hole for this is made by the jig in Fig. 13. This slides in the table vee and is located for distance by the strap butting against one finished end of a screw boss, and it is secured by a temporary set screw in the end hole. A somewhat similar jig serves for the ⅝ inch tapped hole on the side.

The above enumerated tools will cost between $500 and $600 with high speed cutters. The drill press will cost about $700 and it should be able to take care of all this work with a good operator. The large holes for the screw could be done more conveniently on a horizontal boring machine, but this job alone would occupy it but a fraction of the time.

The table gib is planed on the edges in the fixture of Fig. 14. Several are placed in at once, and a planer cut run over them. If this part is cast iron, it will require facing on the flat sides first by customary methods.

### The Drilling Method

The group of drawings included by Fig. 15 illustrate the milling machine method of roughing out saddles. With the exception of the cutter in No. 6, the fixtures and cutters would answer for a full line of sizes in case the manufacturer was making them, and the equipment is capable of producing the same if required. Some manufacturers might use the miller method entirely, and make but the one cut across each face, this serving as both roughing and finishing. The results would be very close, but there is no disputing the fact that the job would not have the accuracy of the second operation method as done on a planer. The comparison would be like that of war tools and pre-war tools.

Lincoln millers of the planer type will do this work as well as plain millers and they cost a great deal less. The five millers required can be bought new and leave half of the price of the vertical miller, for operation 6, for what one 30 x 30 x 8 planer would cost. Fixtures, arbors, and high speed cutters will cost approximately $650. In the drawings T is the miller table. The

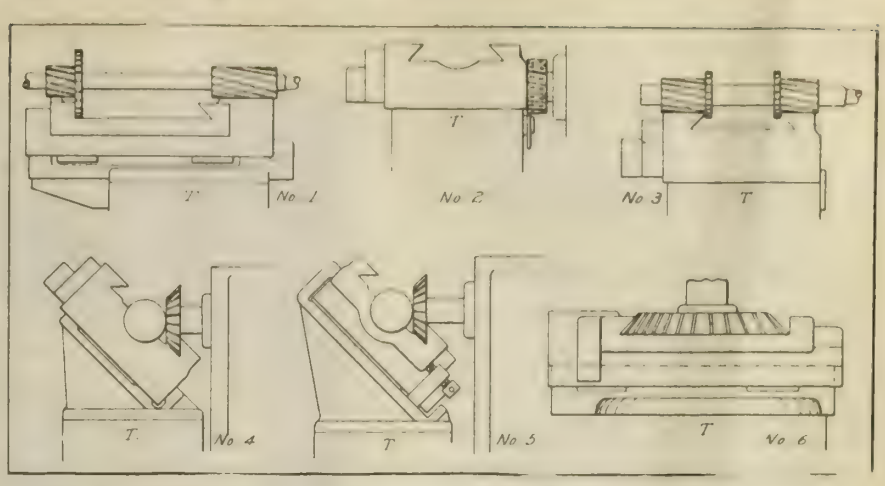


FIG. 15.—THE MILLING MACHINE METHOD OF ROUGHING OUT SADDLES.

clamping bolts and straps are omitted. These are arranged for either one wrench, or hand operation, and to swing or lift out of the way, so there is a clean straightaway for moving the casting on and off.

The drawings explain themselves. Each face as it is cut becomes the bearing surface for the next operation. Nos. 4 and 5 show how the upper vees are machined—the work is held in both cases from the same locating surfaces, and the writer speaks from experience that this is the method that will take all the curse out of a 45 deg. bevel. No. 6 is the method of doing the under vee. This is on a vertical miller, using a cutter with inserted blades (which may be home made), and holding the work by a fixture whose upper part is like the vees of the table. A straddle mill in the gang of No. 1 squares the corner and vertical side so the angular end mill merely scrapes off a finish at this point.

These planer millers should be arranged in a row and timed so that each will finish a piece ready for the next machine. In this way there will be no floor to floor handling, for there should be either a conveyor system or a metal topped table between machines so that the operator can slide the parts along without assistance. At two places along this "railroad," the casting has to be turned over, which may be accomplished by a simple rig. To get the castings up in the 45 deg. position, the conveyor rolls are stepped from horizontal to 45 degrees and the twist is made in a short distance. This railroad is arranged so that the castings cannot fall off. The castings are delivered on the starting end of the line, and the table of the first machine runs right up to this point, then the track begins again where the table travel ends. The casting is removed, and the table run back by hand. One operator can easily attend to three machines, and at a feed of half an inch per minute two castings per hour can be produced on each machine.

### BENDING PIPE

Bending pipe is by no means a simple task. There is always a right and a wrong method. In bending large pipe you should fill the pipe with dry sand and plug the ends. Heat to a red heat in localities to be bent, then bend. Be sure that the sand is dry. Where bends are slight it is often unnecessary to use sand or rosin. The object of sand or rosin is simply to keep the sides of the pipe from collapsing, or, to prevent reduction of flow area. If wet sand is used, and if the ends are plugged, the pipe may burst when heated, due to the steam pressure generated.

Rosin is also good. But there is a "right way" and possibly several wrong ways to use it. For example: A mechanic was recently bending a pipe, and he first of all filled the pipe with rosin, plugged the ends, and heated the pipe at the place where he wanted to bend it. He watched for a "red heat" just as he would had he filled the pipe with sand. The result was of course a violent explosion.

The correct way to use rosin is to pour it into the pipe and allow it to cool and harden. As soon as the rosin is hard, bend the pipe cold. Don't heat it. Then after the pipe is bent, heat the pipe all over sufficiently to melt and remove the rosin.

**Production Foundry Ready.** — Dominion Motor Castings, Limited, of Windsor, have about completed the equipment of their new foundry and expect to be in operation within a fortnight. The foundry has a molding floor of about twenty thousand square feet, and a production capacity of 35 tons of gray iron castings. The equipment is of the latest type and includes at present Osborn machines on the molding floor, McDougall rumblers, Sterling grinders, Preston sand riddles, with much more to be added. The whole plant is designed primarily for high production rather than jobbing purposes. The officials are: President, A. Morrell, formerly of Windsor Machine Company; vice-president, R. P. Marintette; secretary-treasurer, C. A. Ripley.

# *Turret Lathe Applications*

The tooling necessary for machining an engine cylinder, a clutch cone, a clutch cone gear, and a peculiar shaped tractor driving axle arm.

*By J. H. Moore*

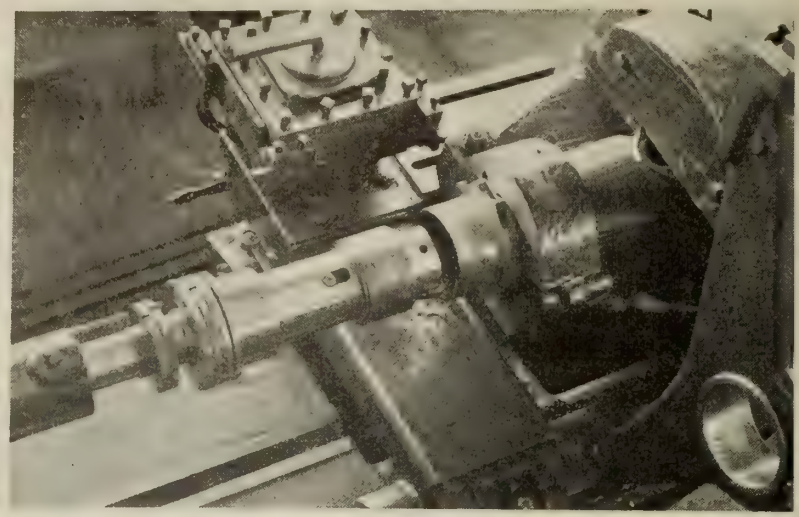

FIG. 3.—A CLOSE UP OF THE CYLINDER IN THE LATHE

IN the present article we will take up a few more examples of work performed on Gisholt turret lathes. The first of these examples is shown at Fig. 1. The piece illustrated is a cylinder used on the Liberty truck engine, and the machining of the same demands some clever tooling. At Fig. 2 we see a complete view of the equipment, while at Fig. 3 is shown a closer view of the expanding boring bar used in finishing the enlarged chamber at the bottom of the cylinder. This bar is depicted at the point of entering the cylinder. Fig. 4 illustrates the tool layout adopted in finishing this cylinder, which is made from semi-steel.

Having explained these essential points let us follow, step by step, the method used in completing this piece. The work is held securely in a special fixture made to suit the shape of the casting. The general design of this chuck can be noted at Fig. 3. This fixture is bolted to the regular chuck of the machine. At the front portion of this fixture there is a hinged arm that encloses the cylinder, after it is mounted in position. A pin is inserted at the chuck end of the fixture, this pin centering and locating the cylinder. Fig. 4 illustrates this clearly. The segment of cast iron, shown at the top of fixture, is simply placed there to counterbalance the weight of the lower part of the fixture.

The surfaces A, B, C, D and E are now rough machined with the tools F and G in the toolpost. Simultaneously the bore H of the cylinder is rough bored with the cutters shown in the head of the boring bar at position 1 of the turret. This bar is supported by means of a steady rest, this rest being shown in diagram form at Fig. 4. It has a bushing in it that fits the outside of the bushing J shown mounted on the bar.

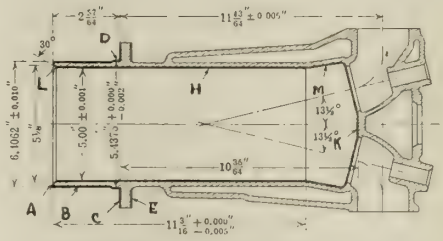

FIG. 1.—SECTIONAL VIEW OF THE ENGINE CYLINDER TO BE MACHINED.

Reference to Fig. 4 should make all these points clear.

The bore H is next finished with a cutter held at position 2 of the turret. The bar which contains this cutter is supported in similar manner to the one already described. The bore H is now reamed by means of the reamer shown at position 3 of the turret.

The next step consists of rough facing the bottom K of the cylinder. This is really called the combustion chamber and the operation is performed by means of the cutter held in the bar held in position 4 of the turret. This bar is provided with a bushing that is steadied by the bore of the cylinder itself.

The surfaces K, L, A, B, C and D are next finished with cutters held in the facing head and bar mounted at position 5 of the turret. The bore of the cylinder at M is now bored with cutters held in the bar shown at position 6 of the turret. These cutters enlarge the bottom, or dome of the cylinder as it is often termed. The cutters are of the expanding type, so that having entered the cylinder, and reached the bottom, they are spread, in this way machining the enlargement. The bar used for this operation is provided with a ball thrust collar which is connected with the cutters in such a manner that when the collar strikes the end A, and the bar still continues to feed in, the cutters are expanded. The collar we speak of is clearly shown at Fig. 3.

The under side of the flange E is next

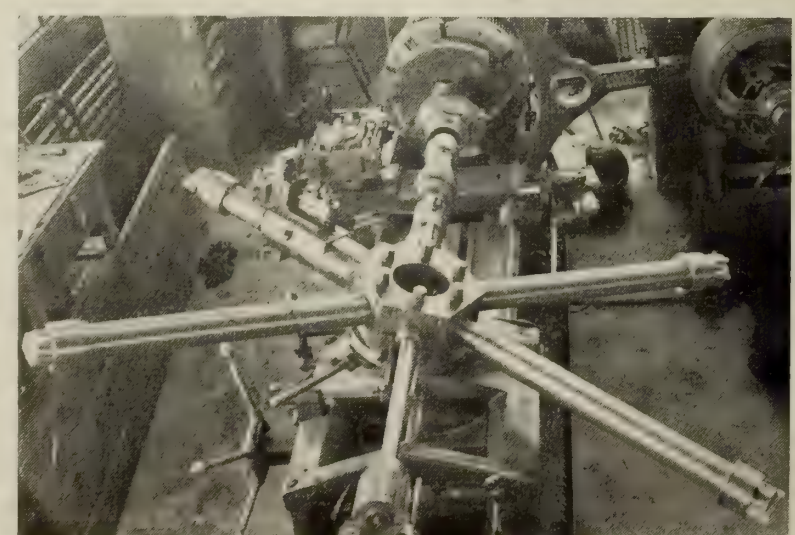

FIG. 2.—A TOP VIEW OF THE TOOLING EQUIPMENT USED ON PIECE AT FIG. 1.

finished with the tools held in the holder O in the toolpost. This completes the cylinder, and the total time of all operations is 25 minutes floor to floor time.

### Clutch Cone Gear

The next example is that of a clutch cone gear, shown at Fig. 5. The surfaces to be machined are depicted by means of heavy lines, and the work is completed in two operations. Figs. 6 and 7 show the first and second operations respectively, while Fig. 8 illustrates the style of taper boring head used for boring this gear. Referring to Fig. 6, it will be noted that in the first operation the cone is held by its large conical end next to the chuck. Special chuck jaws are bored to fit the outside tapered surface, and in this operation the hub is

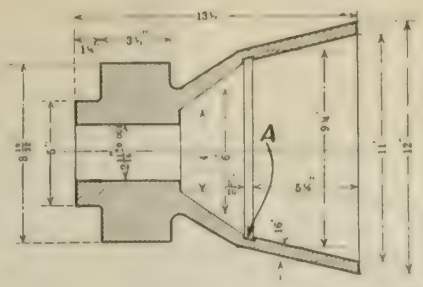

FIG. 5. SECTIONAL VIEW OF CLUTCH CONE GEAR.

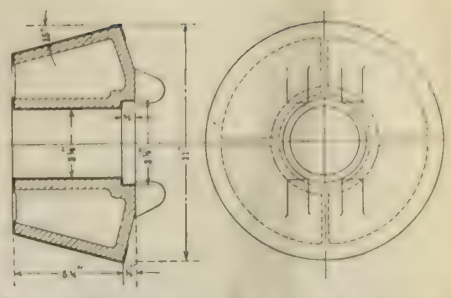

FIG. 9 SECTIONAL VIEW OF THE CLUTCH CONE.

turned by tools in the toolpost. On this being completed, the inside tapered surface is bored with the tool depicted at Fig. 8. The inside and outside are bored and turned simultaneously as can be noted at Fig. 7. In this photograph both

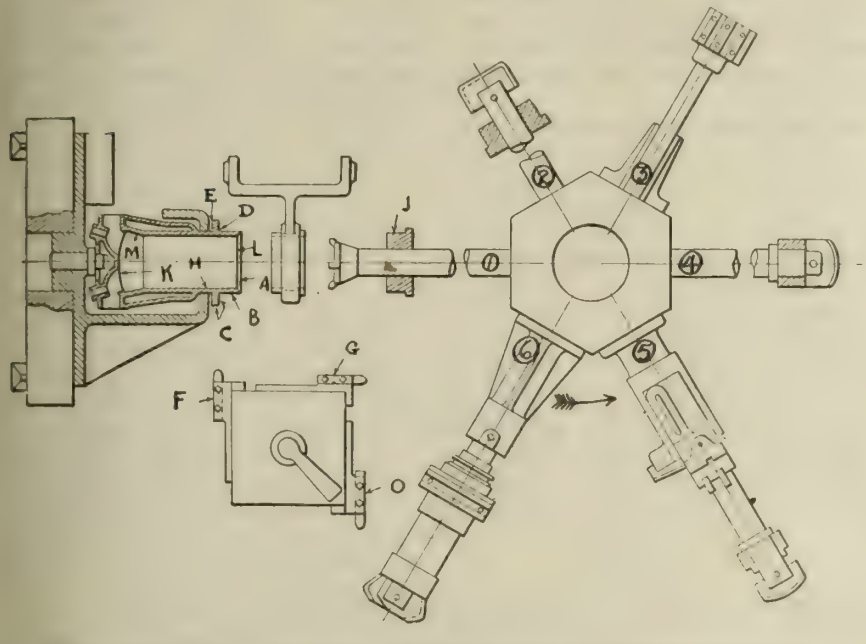

FIG. 6.—LAYOUT OF TOOLS FOR FINISHING THE CYLINDER SHOWN AT FIG. 1.

faced, the hole bored and the front end and outside of the gear are machined.

The work is now turned around and held as shown at Fig. 7. In this case the machined outside surface of the gear is gripped, and the work held in position with soft jaws. The outside tapered surface of the cone is rough and finish the turret tools and the toolpost are shown in action.

It will be noted that a clutch cone part is shown in section at Fig. 8. This is done in order to make clear the action of the special taper boring head. The cone shown in the illustration is of slightly different design, but in the main the principle is the same. The taper for the friction is bored with a single point tool which is properly guided to produce the correct angle. In action here is what occurs: A pilot enters the bushing on which the clutch cone is centered. This guarantees that the friction cone will be concentric with the hub. A ball thrust bearing is provided at B, and this bearing bears against the end of the bushing in the chuck, in this way preventing the pilot from entering further into the hole.

In this way the tool is properly located with relation to the tapered surface. As the head is fed forward over the pilot, a pin resting against the angular surface C guides the tool in at the proper taper, the slide holding the tool being forced down by a spring as the head feeds inward.

The recess shown at A, see Fig. 5, is cut with the tool held in the long tool holder shown in the toolpost at the front in Fig. 7. This recess must be made in the way to provide clearance for the tool in the taper boring head mounted in the turret. The complete time on both these operations is 60 minutes.

### The Cone

Let us next consider the cone used on the gear just described. The piece is shown at Fig. 9. This piece is finished on all surfaces shown in heavy lines and the material is cast iron. Two operations are necessary to complete the part, and Figs. 10 and 11 illustrate both operations on this piece. In the first operation, see Fig. 10, the cone is held in the chuck by means of special chuck jaws which grip it on the inside at the small

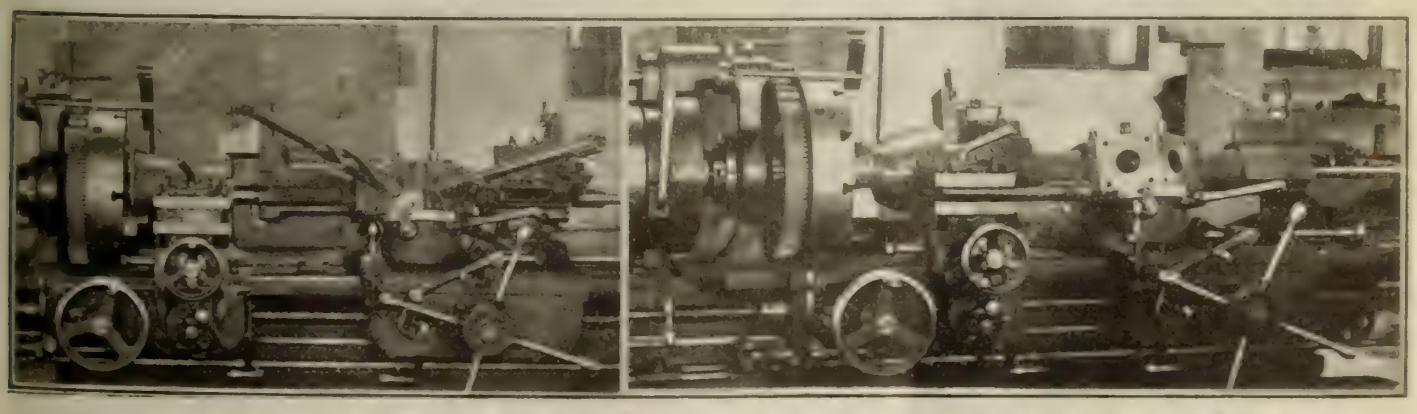

FIG. 6.—TOOLING USED ON FIRST OPERATION OF CLUTCH CONE GEAR.

FIG. 7. THE SECOND OPERATION ON THE SAME PIECE.

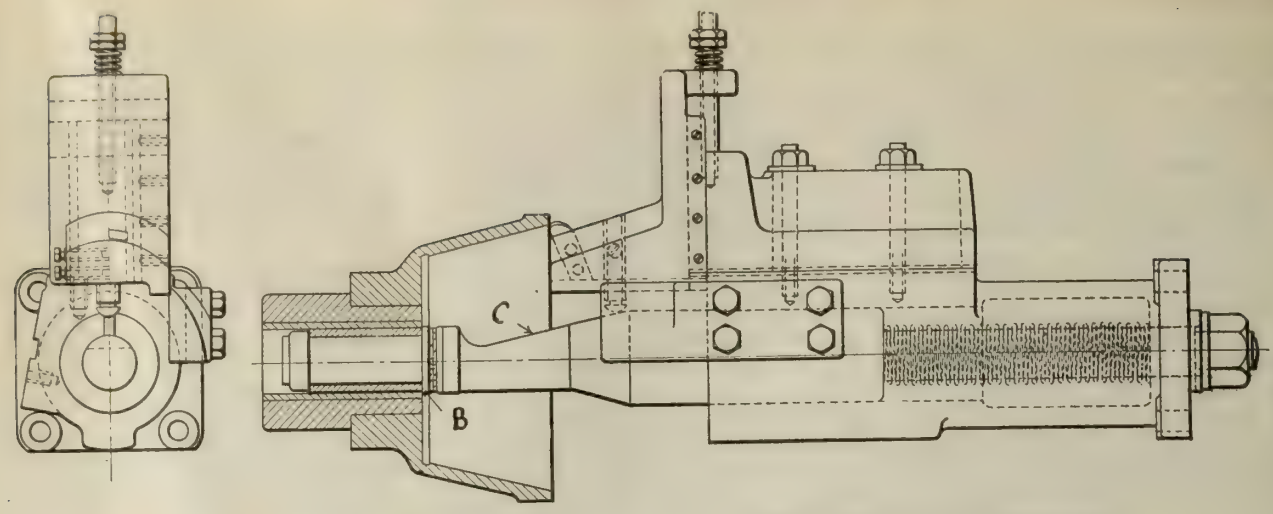

FIG. 8.—DETAILS OF TAPER BORING HEAD USED IN BORING THE CLUTCH CONE GEAR.

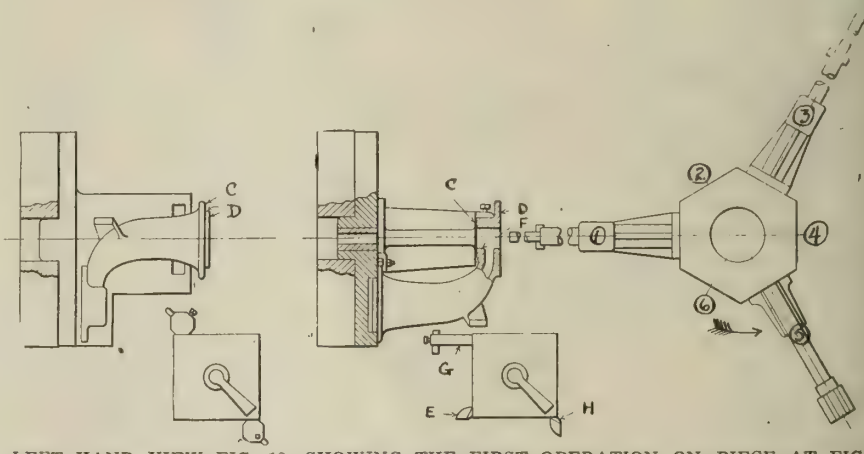
end of the taper. The outside of the cone is then rough and finish turned with tools held in the toolpost. At the same time the inside is rough and finish bored, also reamed by the various tools in the turret.

The work is held by soft chuck jaws in the second operation, and is gripped on the outside of the large end of the tapered surface. This is clearly shown at Fig. 11. The small end of the cone is then faced by a tool held in the toolpost, this completing the operation. The total time required for both these operations is 25 minutes.



### Tractor Driving Axle Arm

The remaining example in the present article is shown at Fig. 12. This piece is what is known as a tractor driving axle arm, and is machined on a 24-inch lathe. It can be readily understood that the chief difficulty in handling a piece of this nature is the deciding on the best method of holding. The arm is made from cast iron and is machined on the surfaces indicated by the heavy lines.

In the first operation the work is held on a special angle plate as shown at Fig. 13. It will be noted from this view that the work is held in vee blocks. The piece is now rough and finish machined on the surfaces C and D. This is accomplished with tools held in the toolpost, the time required for this work being nine minutes.

The tool layout for the second operation is shown at Fig. 14. This work consists of boring the hole in the outward end of the arm and facing the flange. The rear side of hub at C is also faced. The work is first placed in a special fixture, which is clearly shown at Fig. 15. The piece is held by clamps that force the finished bottom flange against the chuck plate. In addition to this, an auxiliary supporting clamp is used, this steadying the arm near the end where it is machined. The flange shown at D in Fig. 14 is next rough faced by means of the tool E in the toolpost.

The hole F is now rough bored with the cutters held in the bar at position 1

LEFT HAND VIEW FIG. 13, SHOWING THE FIRST OPERATION ON PIECE AT FIG. 12. THE OTHER VIEW, FIG. 14, SHOWS THE SECOND OPERATION.

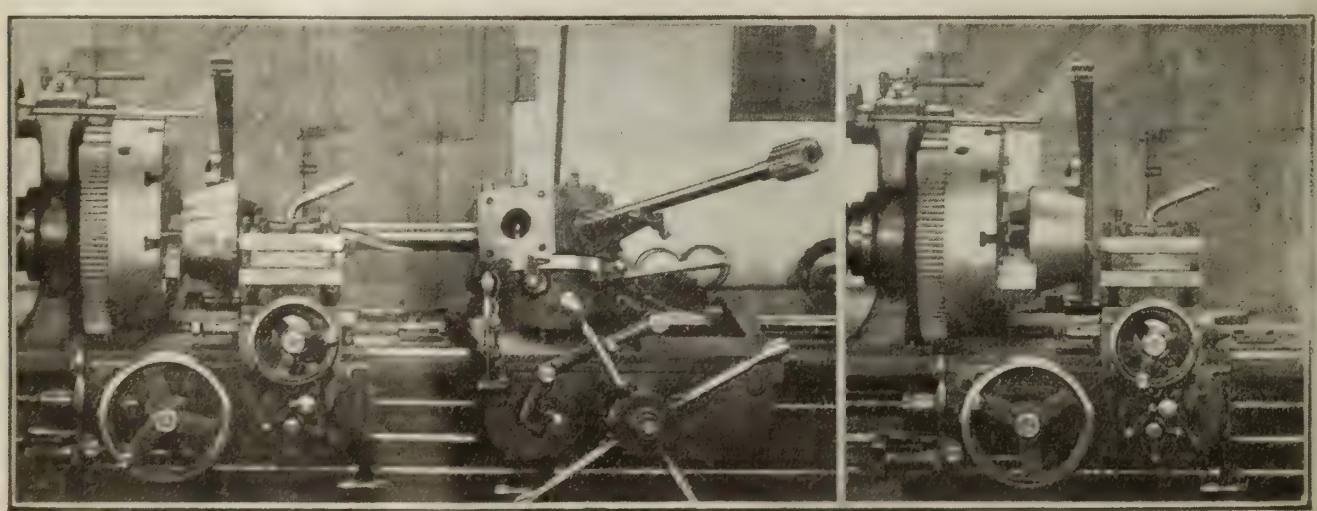


FIG. 10.—THE FIRST OPERATION ON THE CLUTCH CONE.

FIG. 11.—THE SECOND OPERATION ON THE SAME PIECE.

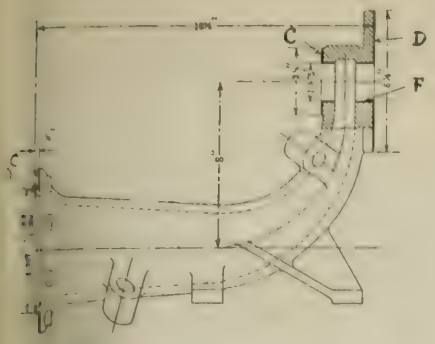

FIG. 12. HERE IS A PECULIARLY SHAPED PIECE TO MACHINE ON A TURRET LATHE.

of the turret. The same hole is finish bored by the bar at position 3 of the turret. After the finish boring it is reamed with the reamer at position 5 of the turret. After this, the face D is finished with the tool H in the toolpost, the rear face C of the hub is next faced with a tool held in the bar G mounted in the toolpost. This bar can be clearly seen at Fig. 15. The total time for this second operation is 9 minutes.

In a later issue we will show still further examples of work performed on these lathes.

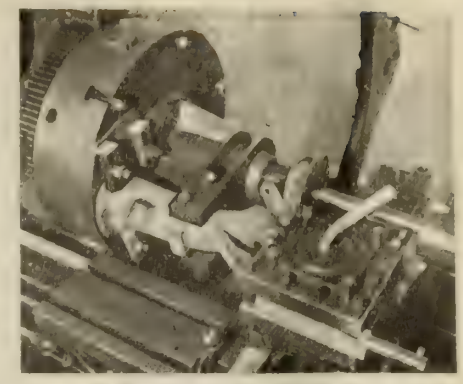

FIG. 15. A DETAIL VIEW SHOWING THE WORK HOLDING FIXTURE.

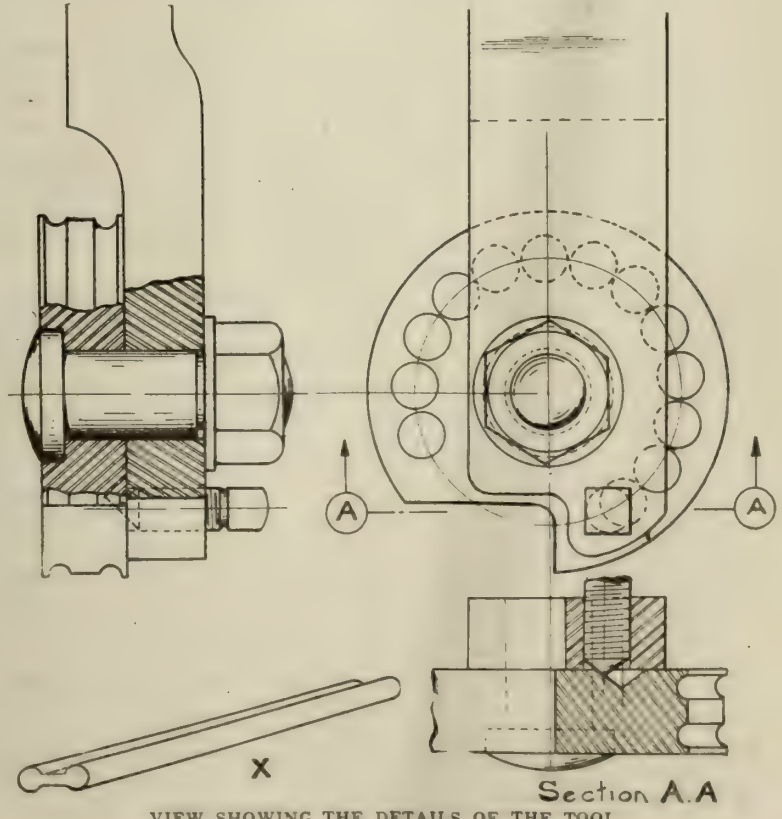

# A Shaper Form Tool of Interesting Design

By TYKE

FORM tools can be successfully and economically used in the producing of duplicate pieces even though nly a few parts are required. By few, f course, we mean at least a hundred, s less than that quantity makes the ini- ial cost of the tool almost prohibitive.

Some time ago we had a few hundred trips to make of the form shown at X." Several methods were tried with aried success, until the writer hit upon he idea of using a form tool in the haper. Previous to this a single con- ave radius tool had been used in the haper but this tool has received a lot f abuse by the different ideas of grind- ig the same; then again, the centre of he circular portion of the strips had to e reasonably accurate, and it was found iat this dimension varied considerably ccording to who had the work in hand. s these strips were wanted from time time, and any lapse of time between ne lot being made up and another re- ilted in an alarming amount of varia- on in the form of same, it was de- ded to make up a form tool as shown the accompanying sketch. One fea- ire of this particular tool that is of terest, and saved considerable time nd trouble, is the method of backing p the tool proper against the shock it ceives upon coming in contact with e work, and of the almost hair-like justment of the cutting edge. This as accomplished by having a circular ries of countersinks on one side of the ol, and having a hardened set-screw ss through an extended portion of the lder at the proper radius from the tre. It will readily be seen that by ewing this set-screw in until its nt just enters the countersink the ular tool is backed up against the pact which takes place when in tion.

Again, after grinding face of tool, it as found that the cutting edge could brought to its proper position by merely giving the set-screw a half turn or so and thereby bringing the cutting edge a little more forward, after which the centre stud nut was tightened up. This special adjustment was found particularly useful when setting the tool in the first instance, as the proper angle of clearance could be easily and quickly arrived at without taking the tool out of the clapper box. Granted, any radial movement of the form tool made a slight variation of the form produced, but this was not of any great importance as the job in question did not call for any microscopical accuracy. After the strips were shaped on both sides, having a pin just strong enough to support it, the strap portion was broken off and the strip placed edgewise in the vise and any fin remaining on the strip was merely shaved off, using one radius of the form tool only. When the tool had been in use some considerable time and frequent grindings resulted in the set-screw registering in the countersink to its full depth, a little more was ground off and the screw point when passed into the next countersink. No doubt the same idea can be utilized in some other form and it is with this in mind that the idea has been passed along.

VIEW SHOWING THE DETAILS OF THE TOOL.

# The Use of Chains and Other Lifting Gears

THE department of internal affairs in London, England, have issued a pamphlet dealing with the use of chains and other lifting gears. This subject is dealt with in considerable detail, but the data to follow form the portion that we believe will be of especial interest to our readers.

The safe working load for chains is given, in tons, as six times the square of its diameter. This differs from the American rule, which is $2.8d^2$—this giving a factor of safety of 4.5. Descriptions of the various types of chain and attachments are given, and the table, as shown in this article, is used to illustrate the safe loads that can be put upon two-legged slings, with the legs at various angles.

The pamphlet also includes some remarks on the testing, inspection and annealing of chains, and concludes with the following summary of precautions:—

(1) Chains and other appliances used for lifting purposes should be obtained from reliable manufacturers. The maximum working load and the purpose for which the chain or appliance is to be used should be clearly stated when ordering.

(2) No chain or other appliance should be used for lifting or similar purposes unless—(a) A test certificate has been obtained from the manufacturers showing the proof load to which it has been subjected and the name of the person responsible for the test; (b) a guarantee has been obtained from the manufacturer as to the quality of the material used, and that the chain or appliance has been thoroughly examined by a competent person after testing and found free from flaws, defects or deformation.

(3) The necessary information should always be available for any person using a chain or other appliance, to enable him to ascertain the safe working load for such chain or appliance.

(4) The maximum working load for any short or close-link chain should not exceed $6d^2$ tons, when used under normal conditions without shock; $5d^2$ tons, where there is any special danger to life or limb, or $3.5d^2$ tons where the chain is subjected to shock or heavy wear, or is used for lifts of molten metal or heated liquid; d being the diameter in inches of the iron of the chain. The maximum working load for a long-link chain should not exceed two-thirds of that for a short-link chain of the same diameter.

(5) When chain slings with two or more legs are used with the legs inclined, care should be taken to ensure that the maximum load in each leg does not exceed that given in recommendation 4 of the table shown.

(6) When the actual weight of an article to be lifted is not known, an approximate computation should be made, and lifting appliances should be used which allow an ample margin of safety.

(7) Load indicators and overload detectors should be used in connection with lifting appliances, especially jib or derrick cranes, whenever reasonably practicable.

(8) Slings or other chains should never be shortened by tying knots in them, and wood or other suitable packing should be provided to prevent the links coming in contact with corners of loads of hard material.

**Safe Working Loads for Two-legged Slings.**

| Chain diameter inches | Safe working loads in tons and cwt. for given angles between legs. 0 deg. | 30 deg. | 60 deg. | 90 deg. | 120 deg. | 150 deg. |
|---|---|---|---|---|---|---|
| 3/16 | 0-8 | 0-8 | 0-7 | 0-5 | 0-4 | 0-2 |
| ¼ | 0-15 | 0-14 | 0-13 | 0-10 | 0-7 | 0-3 |
| 5/16 | 1-3 | 1-2 | 1-0 | 0-16 | 0-11 | 0-5 |
| ⅜ | 1-13 | 1-12 | 1-9 | 1-3 | 0-16 | 0-8 |
| ½ | 3-0 | 2-17 | 2-12 | 2-2 | 1-10 | 0-15 |
| ⅝ | 4-13 | 4-10 | 4-0 | 3-6 | 2-6 | 1-4 |
| ¾ | 6-15 | 6-10 | 5-17 | 4-15 | 3-7 | 1-14 |

(9) Sling chains and other lifting appliances, when not in use, should be stored under cover and kept on suitable racks or pegs.

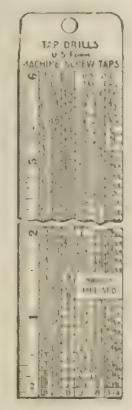
(10) Every chain or appliance used for lifting purposes should be marked with an identifying letter or number, either on the chain or appliance or on a tablet attached thereto.

(11) All chains and other lifting appliances should—(a) If used for lifting in connection with molten metal or molten slag, be examined at least once in every month and be annealed at least once in every six months; or (b) if used in connection with lifting machinery or plant operated mechanically or electrically, or used for lifting in metal foundries other than that mentioned in paragraph (a) above, be examined at least once in every three months and be annealed at least once in every twelve months; or (c) if used for classes of lifts other than those mentioned in (a) and (b) above, e.g., in connection with hand cranes, be examined at least once in every six months and be annealed at least once in every two years; or (d) if used for holding down any crane or other lifting machinery upon a stage or platform should be examined as far as reasonably practicable, in situ, at least once in every three months, and be fully examined and annealed at least once in every twelve months, unless the nature of the operations preclude such examinations and annealing.

(12) A chain or other appliance should not be used for lifting its maximum working load if the wear at any part exceeds 10 per cent. of the nominal dimension of that part, or for lifting any load if it has been subjected to a severe shock or is deformed or otherwise injured.

(13) A chain or other appliance which has been altered or repaired should be re-tested before use.

(14) A record with full particulars should be kept of every chain or other lifting appliance.



## OVERHEATING ALUMINIUM

While it is important to maintain a low-pouring temperature for casting aluminium alloys, it is equally important to avoid overheating the metal in the furnace charges. Doubtless some advantage is gained when overheated melts are allowed to cool to the correct pouring temperature, and part of the danger of overheating is minimized by so doing. Nevertheless, continues the Engineer, for aluminium, overheating is very objectionable because of the rate of dissolution of iron from cast iron melting pots and of the reduction of silica from clay crucibles, as well as absorption of gases from the local atmosphere. For molten metals, the absorption of gases increases with rising temperature, this being possibly due to the fact that metals form loose compounds with hydrogen and nitrogen. The absorbed gases are often held by the metal until solidification starts, when they are liberated and cause unsoundness. Hence an overheated melt would contain more absorbed gases than one not overheated, and it would be expected that castings poured from the former would be more unsound than those poured from the latter.

Switzerland is one of the principal producers of aluminium. In 1918 this country exported 10,500 tons of raw aluminum, to a value of 51,000,000f. To the figures stated must be added 2,000,000f. of bar and sheet aluminium, 6,500,000f. of technical appliances, and 3,200,000f. of other articles in aluminium. With the end of the war in 1919 the export of aluminium technical articles fell off while that of household items was doubled. The latter exports rose to a value of 6,200,000f., of which one-fourth went to Italy and one-fifth to France.

# Have You Tried This Contest Yet? If not--- Do so Now

Below will be found twelve references to advertisements in this number. To the sender of the first correct set of answers to these we will forward one of these scales.
To win one is not difficult, and at the same time you will add to your store of knowledge. Read the details given below.

The scale is 6 in. long and is made from finest quality steel. One side is marked in 32nds, the other side in 64ths. A table of decimal equivalents is also stamped on one side, and a table of tap drill sizes on the reverse side. This scale is well worth securing.

## What You Have to Do

We publish every week a number of interesting facts or statements selected from the advertising pages for that week. The selections for this issue are given below. Read these through, then turn to the advertising section and see if you can pick out the advertisements to which they refer. The work is interesting, it will train your powers of perception and of memory, it costs you nothing, it will make you better acquainted with the various lines of machinery and tools in the market, and with perseverance you are bound to win one of these useful scales as a prize.

We purpose making our contest a little more puzzling. 18 correct lists were received for the twelve queries appearing in the Jan. 20th issue. This places us in a difficult position. Who should get the prize?

After deliberation we have awarded the prize to W. O. Bird, Edmonton, Alta. In a previous issue Mr. Bird sent us a correct list of names, but was a few days late in submitting them. We, therefore, think we shall be acting in accordance with the wishes of our readers in sending him the scale on this occasion.

In future contests the following plan will be adopted. We will place the correct lists face down on the desk and allow some neutral party to pick out one of the lists as the winner. This arrangement will eliminate the date and distance problem for all time, and is fair to all.

**CONTEST FOR FEBRUARY 10TH ISSUE**

**Contestants are required to write us, stating to which advertisements we refer in this number.**

1—What to do if accuracy is of prime importance.
2—How to get the highest rate of production with the smallest amount of lost time.
3—A product easily handled.
4—Something that runs in self-oiling bronze bearings.
5—Something that has been absent for some time.
6—How to cut down expense.
7—A product that requires no special fixtures.
8—Something that gives high speed with practically no vibration.
9—A product that keeps primed.
10—A product said to be a big time-saver.
11—Something that refuses to spurt.
12—A product that is both solid and adjustable.

**These are Correct Answers for List from January 20th Issue:**

1—Walton Co.
2—Wallace Barnes Co.
3—Brown & Sharpe Mfg. Co.
4—National Acme Co.
5—Brown & Boggs Co., Ltd.
6—Jones & Lamson Machine Co.
7—The L. S. Starrett Co.
8—Clemson Bros., Inc.
9—Ritchie Supply Co.
10—Northern Electric Co., Ltd.
11—The Holden Co.
12—Morse Chain Co.

## Closing Date for This Contest is March 3rd.

# Interesting Examples of Vertical Milling

By J. H. MOORE

EXAMPLES of vertical milling machine practice will be shown in this article, but for the benefit of those not familiar with the particular machine on which these various operations are performed, we will briefly discuss the machine itself rather than the work performed. The type of miller shown at Fig. 1 is known as the No. 8 Herbert vertical mill, and is made in the Edgwick shops of the Alfred Herbert, Ltd., Coventry, England. They have given us the following data regarding these machines:

The spindle has a clutch drive, and an external taper for mounting large face milling cutters. The arbors are secured by a draw-bolt. The power is transmitted to the spindle by two eyes. The gearing can be thrown in and out of action without the use of spanners. For heavy cutting the drive is through a large spur gear. The main spindle bearing is of phosphor bronze with adjustment for wear. The pulley runs upon a sleeve so that none of the pull of the belt comes upon the spindle. The sliding head is balanced and has quick adjustment by pilot wheel for setting and fine adjustment by hand wheel for putting on the cut. The fine adjustment has a large adjustable index disc. The various handles are brought well out to the front so as to be easily accessible. A locking lever is provided for clamping the spindle slide, and a stop with screw adjustment for regulating its position.

The steady bracket for carrying the lower end of the arbor is arranged to swing out of the way when not in use. It has two positions vertically so as to come close to the main table or the circular table, according to which is in use. It may be raised and lowered by connecting it to the sliding head, a convenient device being provided for this purpose. A profiling roller can be attached to the steady bracket when desired. The holder for the profiling roller has screw adjustment for putting on the cut, and is quite independent of the arbor support, which can therefore be used to support the cutter when profiling. All gears are enclosed.

### Main Tables

The flush-top table is provided with ample channels for containing and carrying away the lubricant, a covered way being provided from end to end. Both longitudinal and cross movements have self-oiling slides. The transverse slide is guided by a raised tongue in the centre and is held down by gib plates on the outside edges of the base—the guiding of the slide thus being performed by the central tongue, which, being long in proportion to its width, gives a smooth working slide. Automatic feeds are provided both to longitudinal and transverse movements. Both feeds are reversible from the front of the machine and have automatic and dead stops. The dead stops are arranged to act after the automatic stop, rendering it impossible to break anything by feeding into the dead stop. The longitudinal feed nut is adjustable for wear, and the thrust of both feed nuts is taken by ball thrust bearings. The feed is varied by a patent dial feed motion. To obtain any feed the dial is simply rotated until the number corresponding to the feed required comes opposite the pointer, no other moveemnt being required. The various feeds are all obtainable with any of the spindle speeds.

The cross feed and longitudinal feed hand wheels are at the front of the machine, and the hand wheel controlling the vertical motion of the spindle head is brought well out to the front. All three motions can be operated without the workman changing his position. This feature renders the machine particularly suitable for irregular work such as die sinking. All the movements have large, easily read, adjustable graduated index discs.

### Actual Work Performed

Having touched briefly on the mechanical features, let us consider various applications of the machine to typical milling work. At Fig. 1, is shown one of these millers machining a die. Most of the dies produced on the machine shown are of the drop forging type, but where a mill is used for continually reproducing dies as they wear out, a special attachment can be attached which works as follows:

First, a wooden pattern is made, and a former is cast from this pattern. Of course the former is a duplicate shape of the die desired, and is so shaped that it can be bolted on an angle plate on the machine, and can be adjusted for height. A guide pin is made to follow the former, feeding by hand automatically, according to the cuts to be taken. This makes it possible to mill a die approximately the same as the former without spoiling it by relieving too much metal.

Fig. 2 illustrates an example of actual practice in their own shop. The work

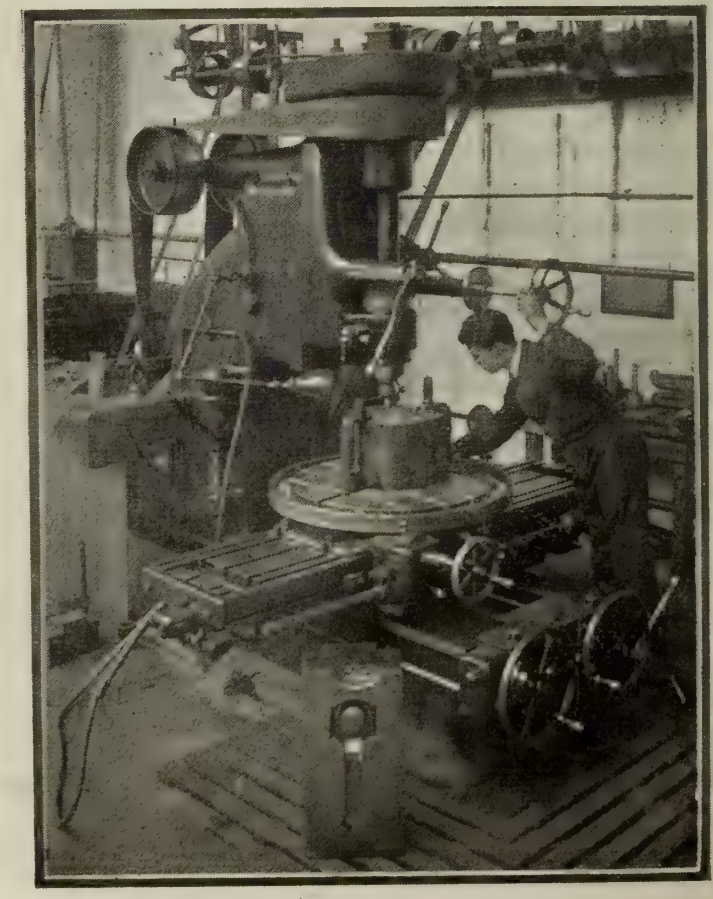


FIG. 1.—DIE SINKING ON A VERTICAL MLLER.

FIG. 2.—MILLING STOP ROD BRACKETS.

FIG. 3. MILLING THE TOP FACE OF MACHINE CABINETS.

being performed is that of milling the stop rod brackets for their No. 9 combination turret lathe. It will be noted that the brackets are clamped directly to the table with ordinary shop clamps. The inserted tooth face cutter shown in photograph is 4 inches in diameter, and runs at 57 r.p.m., the feed being 5⅜ inches per minute. About 36 castings are machined on both sides between grindings of the cutter.

Fig. 3 depicts how this concern mills the top of cabinets for their No. 9 turret lathes. These pieces are clamped directly to the table, and are machined with a 12-inch inserted tooth face cutter which runs at 19 r.p.m. A feed of 5⅜ inches per minute is employed.

Another example of Herbert practice is shown at Fig. 4. In this case the operation is that of milling the facings on the sud trays for their No. 1 hexagon turret lathes, and a 12-inch inserted tooth face cutter is used. The cutter runs at 19 r.p.m. and has a feed of 5⅜ inches per minute.

### The Last Example

The remaining example is shown at Fig. 5, and depicts the use of the circular table, on top of the regular table. The nature of the work is clearly seen, also the method of clamping. An inserted tooth cutter is used on this work. In conclusion let us quote what this concern have to say regarding the use of this type of machine for die sinking.

"Die sinking is perhaps the most awkward and difficult of milling processes.

"In die sinking the cutters have to be continually changed. Their direction of travel is constantly altering and the depth of cut is continually varying from moment to moment. Whilst the horizontal machine is broadly the machine for straight cuts and repetition work as by gang or form cutters, the vertical machine is to our mind the machine for variety. It will drill holes, mill faces, edges, slots and undercuts. It will mill at the bottom of recesses and sometimes has to perform most or all of these operations on the same article. It is easily manipulated and the cutters are cheap and easily maintained. Vertical milling is usually a cheap operation. Fixtures for holding the work are simple and easy to set; the actual milling being practically continuous."

### NEW FUEL

A new compound fuel, named thermalene, has been produced by Karl Wolf, of Zurich. It is a mixture of acetylene and vaporized oils, and is claimed to have important advantages over other gases as a fuel for high temperatures. As now manufactured, the generating mixture, consisting of alternate layers of calcium carbide and crude oil absorbed in sawdust, is packed in tin cans, the largest yielding 200 cubic feet of gas. The addition of water liberates the acetylene, and the heat of the reaction converts the oil into vapor. The two gases are cooled and purified, ready for use in the pipes. The gas mixture is not corrosive or poisonous, has an inoffensive odor and is not liable to cause explosions. At normal temperature, thermalene, which is somewhat heavier than air, is liquefied by a pressure of 1,500 pounds or 1,600 pounds per square inch.

Premises have been leased at Kingsville, Ont., by the McIllroy Belting & Hose Co., Hammond, Ind., for their Canadian branch.

# WELDING AND CUTTING

## The Canadian Welding Society Develops

### At the Second Meeting of This Society Nominations for Officers Were Held, Later Plans Arranged and Provisions Made for the Formation of Branches Throughout Canada

THE second organization meeting of the Canadian Welding Society was held in the L'Air Liquide Society offices, Toronto, Canada, on January 26th. Matters of considerable importance were transacted, and the meeting adopted the constitution and by-laws as placed before those present.

Nominations for officers and members of the board of directors were made, with the following results:

**For President**

A. M. Barry, vice-president, St. Lawrence Welding Co., Ltd.; Prof. H. E. T. Haultain, Mechanical Engineering Department, University of Toronto; W. H. Wood, Canadian manager, Commercial Acetylene Supply Co., Inc.

**For Vice-President**

F. Borys, commercial manager, L'Air Liquide Society; R. H. Combs, general manager, Prest-O-Lite Co. of Canada, Ltd.; J. F. Crowley, Ontario sales manager, Davis-Bournonville Co.; F. J. Hamilton, manager, Canadian John Wood Manufacturing Co., Ltd.; T. Jones, works manager, Canadian Vickers Limited; H. E. Mussett, sales manager, Canada Carbide Co., Ltd.; C. Royer, manager, Welding & Supplies Co.

**For Directors**

A. M. Barry, vice-president, St. Lawrence Welding Co., Ltd.; F. Borys, commercial manager, L'Air Liquide Society; A. Girouard, Montreal manager, L'Air Liquide Society; D. N. Griffiths, sales department, Union Carbide Co. of Canada, Ltd.; F. J. Hamilton, manager, Canadian John Wood Manufacturing Co., Ltd.

Prof. H. E. T. Haultain, Mechanical Engineering Department, University of Toronto; J. G. McCarty, Canadian manager, Metal & Thermit Corp.; A. J. MacDougall, vice-president, National Electro Products Limited; S. L. Montgomery, sales manager, Prest-O-Lite Co. of Canada, Ltd.; H. E. Mussett, sales manager, Canada Carbide Co., Ltd.; R. E. Smythies, Engineering Department, Lincoln Electric Co. of Canada, Ltd.

W. F. Thatcher, general manager, Dominion Oxygen Co., Ltd.; R. A. Witherspoon, vice-president and general manager, Canada Carbide Co., Ltd.; W. H. Wood, Canadian manager, Commercial Acetylene Supply Co., Inc.

The elections are to be by letter ballot, everyone sending in his membership application form being eligible to vote at this first election. Application blanks, ballot forms, and information regarding the society are to be mailed very shortly to all those in Canada who should be interested.

The society wishes to point out that it is almost impossible to get in touch with all prospective members. Therefore, no one is to feel slighted if he does not receive further information. Merely write to Canadian Machinery or to the society, and all necessary forms will be sent.

It has been decided to hold the first annual meeting on March 15 in Montreal, and at that meeting the ballots will be opened. This means that all letters should reach Toronto not later than March 13.

One of the most important items regarding the society is the provision made for the formation of sections or branches throughout Canada.

Any group of fifteen or more men eligible for any class of membership may make application for the formation of a section. These sections may be in a city or part of a city or any town, village or part or all of any province or district. In fact, no definite limits are made on geographical location. It is hoped that before the first annual meeting, applications will be received for the formation of sections in Hamilton, Montreal, Toronto, and Vancouver, possibly from others, for there cannot be too many. Anyone interested in the formation of a section should write the society.

The society will place few restrictions on the sections. The main thing is that the section by-laws must not conflict with the aims of the society, and that none of the sections shall develop into labor organizations. The society will refund to each section 50 per cent. of all membership dues received from members enrolled in that section. Also each section will be entitled to elect a member of the board of directors of the society.

The society is to meet twice a year, but no restrictions are placed on the sections. In fact, it is proposed that they meet at least once a month. At these meetings papers may be read from men prominent in the welding industry, discussions may take place regarding the outstanding welding problems, or anything of a similar nature. This phase of activity is left largely to each individual section.

Officers of the society, however, will lend all possible aid to the sections. The secretary will assist in the compilation of by-laws, in arranging for papers to be read, etc. While certain restrictions are placed on members in the various classes in the society, these restrictions do not necessarily need to be included in the section by-laws. Each section is to make its own rules regarding this point.

The greatest latitude is to be given to the sections in the conduct of their own affairs, and it is hoped that all branches and the main body may be able to work together for the general advancement and betterment of the welding industry in Canada.

The meeting held in Toronto, while of necessity somewhat limited as to attendance, showed the strongest interest.

It was also the opinion of those present that while everything could not be done the first year, still the society should be gotten under way without delay and should carry out whatever was possible, and that even the smallest activities would be of benefit.

Those present at the meeting were as

follows: A. M. Barry, vice-president, St. Lawrence Welding Co., Ltd.; F. Borys, commercial manager, L'Air Liquide Society; P. F. Briggs, welding instructor, Toronto Technical School; S. E. Brock, Canadian General Electric Co., Ltd.; J. H. Carson, manager, National Electro Products Limited; R. H. Combs, general manager, Prest-O-Lite Co. of Canada, Ltd.; J. F. Crowley, Ontario sales manager, Davis-Bournonville Co.

D. N. Griffiths, sales department, Union Carbide Co. of Canada, Ltd.; F. J. Hamilton, manager, Canadian John Wood Mfg. Co., Ltd.; L. H. Holman, manager, Engineering Services Limited; Jas. Honan, sales department, Dominion Oxygen Co., Ltd.; E. J. Houghton, sales department, L'Air Liquide Society.

W. M. Leith, sales department, Dominion Oxygen Co., Ltd.; A. McDougall, engineering department, L'Air Liquide Society; A. J. MacDougall, vice-president, National Electro Products Limited; H. T. Madge, oxy-acetylene welder, C. N. R. Leaside Shops; J. C. Minns, sales department, Canadian General Electric Co., Ltd.

J. Moss, advertising manager, L'Air Liquide Society; H. E. Mussett, sales manager, Canada Carbide Co., Ltd.; F. J. Padbury, manager, Toronto Welding Co.; J. N. Robinson, managing editor, Canadian Welding Journal; C. Royer, manager, Welding & Supplies Co.; R. E. Smythies, engineering department, Lincoln Electric Co. of Canada, Ltd.

F. Staddon, sales department, L'Air Liquide Society; A. A. Stewart, secretary, Canadian Welding Journal; J. Sykes, electric welder; L. Sykes, sales department, L'Air Liquide Society; W. F. Thatcher, general manager, Dominion Oxygen Co., Ltd.; F. G. Tripp, Canada Carbide Co., Ltd.; W. H. Wood, Canadian manager, Commercial Acetylene Supply Co., Inc.; D. L. Wright, L'Air Liquide Society.

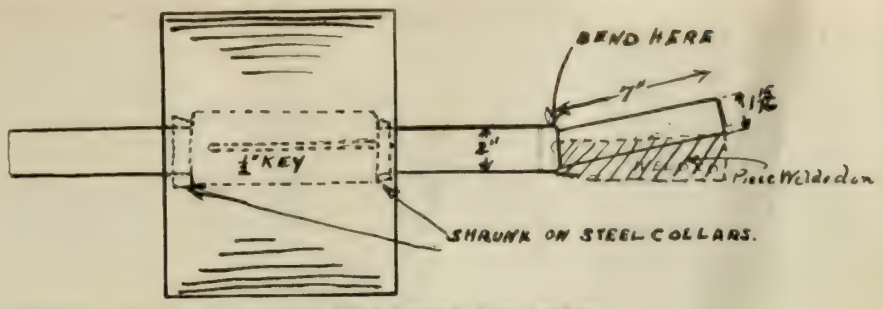

DIAGRAM OF ROTOR AND SHAFT.

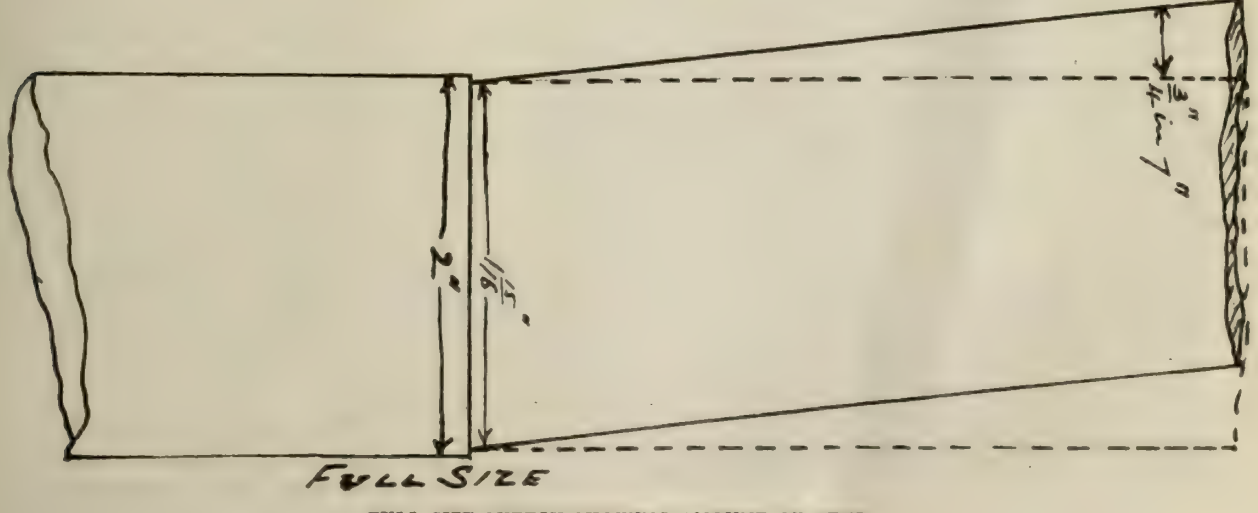
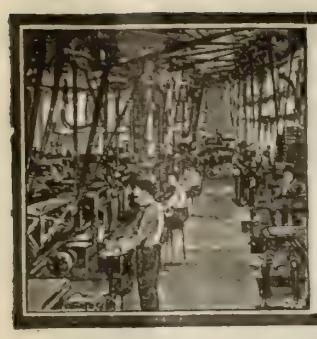
## STRAIGHTENING ROTOR SHAFT

Recently I was given a job straightening a 2 in. rotor shaft, which was bent right at shoulder on pulley end, and as I thought it would be next to impossible to straighten it without taking shaft out of rotor, and as it is quite a job to take same out and place it again, I did it in novel way, which may interest some of our engineers.



The rotor shaft in question was bent in transit by the railway company and was out about ¾ in. As our readers well know only .008 inch is allowed between stator and rotor laminations, so it is seen that rotor shaft must be perfectly straight.

I did not care to heat it nor hammer it, so we had one side built up with electric arc welding process, then rotor was set up in lathe, welded end in steady-rest, faced and new centre put in, and then shaft turned to 1-64 oversize and then ground to exact size; it was then impossible to tell any defect nor that shaft had ever been welded. Operation took six hours and rotor never got hot enough to melt solder out of rotor rings.



ERNEST QUIST.

The idea shown above is quite satisfactory as regards truing the shaft. It does nothing, however, to relieve the strain set up on the fibres of the shaft at the shoulder, where it was bent. We think that the rotor could have been protected by a shield from radiant heat and the shaft warmed at the bend by a blow torch and straightened up by pressure. It could then have been heated to a dull red for two or three inches each side of the bend, and allowed to cool, after which it could have been trued up in the lathe. The insulation would not have been damaged in this way, and the molecules of the metal would have been returned to their normal condition. As it is a certain amount of initial stress is present when no load is on the shaft, and this the welding would not help. We would like to hear some opinions from our readers on this.—Editor.

Can you imagine a house built of straw? The French are really thinking of building straw houses to remedy the present housing crisis. The proposal is said to have emanated from an expert in textiles, who has invented a process for making bricks from compressed straw. The framework of the house is made of wood, and the walls are built up of blocks of straw. Owing to the lightness of the material, there is no need for deep foundations, and the whole building can, it is said, be completed in a month. It is stated that the straw preparation is no more inflammable than are bricks. The first straw house has already been built at Montargis, and if it proves a success it is possible that, owing to the rapidity with which such houses can be built, the new invention may be utilized in the devastated regions.

FULL SIZE SKETCH SHOWING AMOUNT OF BEND.

# DEVELOPMENTS IN SHOP EQUIPMENT

## INTERNAL GRINDING MACHINE

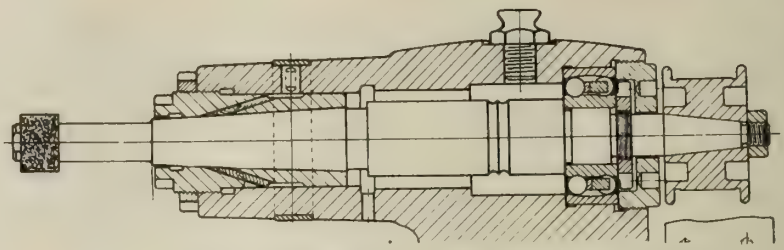
The Heald Machine Co., Worcester, Mass., has added another machine to its present line of grinders. This new machine is known as the No. 80. The front view of the machine is shown at Fig. 1.

The workhead of the machine is driven by a cross belt through the base from a cone pulley giving three speeds. It is arranged to swivel, and is graduated to 45 degrees, or 4-inch taper to the foot.

The main drive pulley is connected to its shaft through a friction clutch and provided with a brake, both of which are so connected with the wheel-slide that when the latter is drawn back both the work and the pump are automatically stopped. At the same time, and without attention from the operator, a small guard swings over the grinding wheel to protect the operator from injury due to accidental contact. No time need be lost in gauging the work, or in substituting another piece for the finished one.

The wheel-slide, or table, is reciprocated by a pinion at the upper end of a vertical shaft, driven through a double friction clutch under control of the operator. By shifting a single lever the traverse is changed from power to hand movement without the possibility of both being engaged at the same time. This enables the operator, as soon as the grinding wheel is clear, to run the slide back quickly for the purpose of gauging or removing the work. This table slides upon flat and V ways. The power traverse may be set to any desired point of reversal. The table drive is through a two-step cone, thereby providing two rates of wheel traverse.

At the wheel end the spindle runs in a bronze tapered bearing that allows for adjustment to compensate for wear. At the pulley end a ball bearing is provided. The wheel-heads are made up as complete units, each having its own pulley, thereby insuring correct spindle speeds. A section through one of these wheel-heads is shown at Fig. 2.



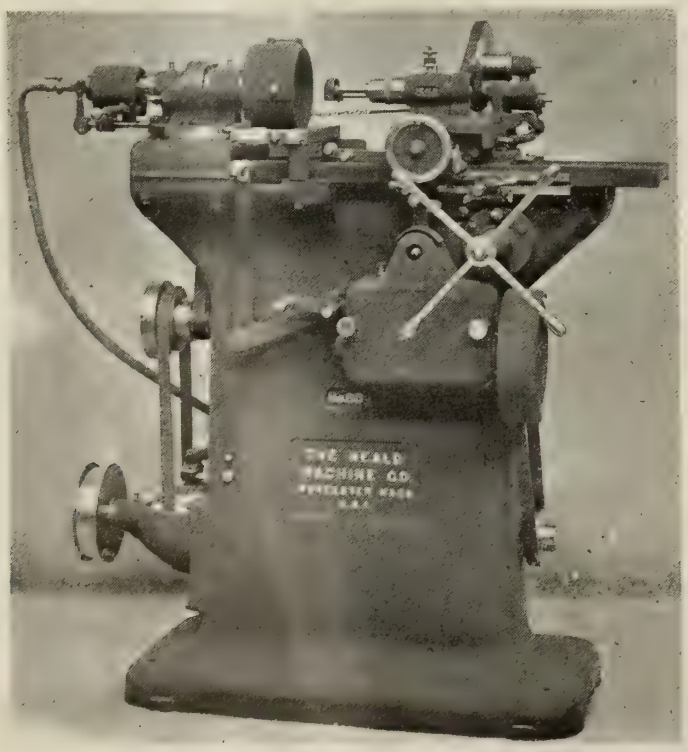


FIG. 2.—SECTIONAL VIEW OF ONE OF THE WHEEL HEADS.

The cross-slide may be operated by power feed or by hand, and the power feed is so calibrated as to work to half thousandths of an inch on diameters. The overhead countershaft, supplied with the machine, has an idler to keep an even tension on the belts.

GENERAL VIEW OF THE GRINDING MACHINE.

## MULTIWHIRL COOLER

The Griscom-Russell Company, 90 West street, New York City, manufacture a device for the cooling of oil used in the lubrication of turbine bearings, reduction gears or quenching oil in the heat treating of steel. In either case the oil is constantly circulated through the cooler, thus maintaining the oil at a constant temperature and permitting the continued use of the original quantity of oil and its maintenance at the proper viscosity for efficient results.

The apparatus takes its name from the whirling path of the oil, which path is accomplished by the use of the helical baffle which directs the oil in its flow without appreciably retarding its progress. This baffle also serves to bring the oil into intimate contact with the cooling surface and it insures a high rate of heat transfer.

The shell is of cast iron and the tubes of seamless drawn brass or copper, expanded into a fixed tube plate at one end and into a floating head at the other, which latter permits expansion and contraction without strain on the tube joints.

## AUTOMATIC TUMBLING BARRELS

The Ideal Concrete Machinery Co., Cincinnati, Ohio, have placed on the market an automatic tumbling barrel

that is a decided departure from the ordinary style of barrel.

This barrel has the action of the regular type, but it tumbles much faster.

It can be loaded automatically from ground level and discharges the work directly into buckets or buggies, without stopping the barrel. Much time is saved in loading and unloading the barrel, also in tumbling.

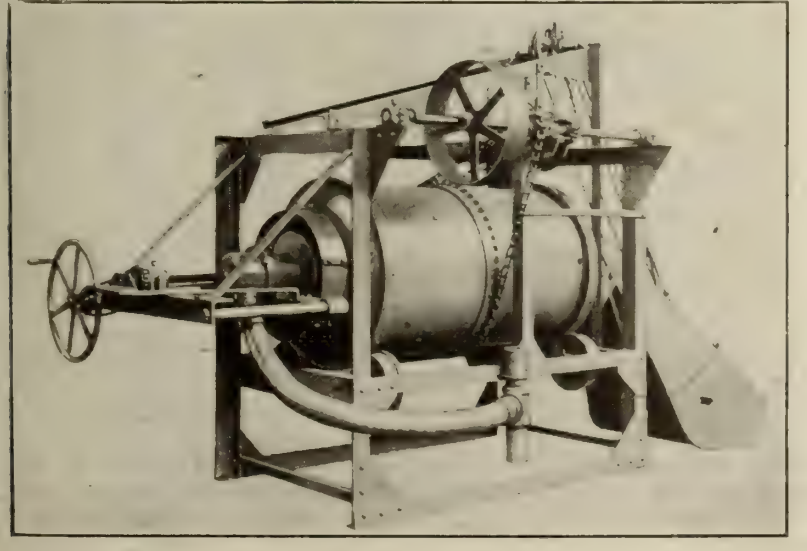
The work can be held in the drum as long as desired, and the operator can at all times see the progress of the tumbling, thus ensuring that it will not be over tumbled or not tumbled enough. The barrels can be furnished for exhaust tumbling, wet tumbling, also equipped with slats for separating trimmings. The illustration shows a 36 by 60-inch barrel equipped with exhaust, and these barrels can be furnished in the following sizes: 24-in. x 30-in., 36-in x 48-in., 36-in. x 60-in., 42-in. x 60-in., 48-in. x 60-in.

The shell of the mill is made of ¾-in. steel plate, rolled true to size and butt welded. The drum heads are castings ¾-in. thick and protected from wear by steel bands shrunk around the running track. They are also equipped with ¾-in. removable wearing plates on the inside. The drum revolves on chilled iron rollers 12 inches in diameter. These rollers are rigidly fastened to the roller shafts, which run in flexibly hung Hyatt roller bearings. The journals of the roller shafts are case hardened.

The frame of the machine is built of heavy angle iron, well stiffened with gusset plates and hot riveted. The power loading skip is raised by a 14-inch contracting band hoist and an automatic stop prevents the loading skip from being hoisted too far.

These tumbling barrels are adapted for tumbling bolts, nuts, stampings, drop forgings and small castings, either grey iron, steel, malleable or brass.

## ROTARY MILLER



The Craftsman Tool Co., Conneaut, Ohio, have placed on the market a line of continuous rotary millers. These machines are somewhat similar in design, and the No. 3 size, which is the largest, is provided with two rocker arms and driving pulleys. This insures greater power and at the same time enables the operator to make two adjustments for depth of cut and two separate operations can be handled by the machine at the same time.

Parts up to 2½ inches in diameter, and up to 6 inches in length, can be handled on this machine. Thirty feeds are provided, and the machine is equipped with compound feed gears. A glance at the illustration will show the machine's general appearance.

These machines are used for castellating, screw slotting, slab milling, straddle milling, plain milling, etc. The work is milled by being fed into the chuck as it rotates, each jaw being full as it comes under the cutter the operation is thus continuous. As each independent jaw of the chuck approaches the cutter it is closed automatically by the two roller bearings between which it passes. The work at the same time resting upon the central plate is thus held in positive position while being machined. As the work leaves the cutter the chuck in turn automatically opens and the parts drop from the chuck and pass from the machine through a chute which makes the machine semi-automatic.

In castellating the nuts have to pass through the chuck three times but due to the fact that the operation is a continuous one the production is very satisfactory, ranging from 1,200 slots per hour on ½-inch nuts up to 2,100 slots per hour on ¼-inch nuts. This insures a production of 400 to 700 complete nuts per hour.

The machine is equipped with a pump and a lubricant tank in the base. Attached to the right is a metal container for holding the parts to be milled which has a capacity for a half day's run.

GENERAL VIEW OF AUTOMATIC TUMBLING BARREL.

VIEW SHOWING THE CLAMP IN USE.

## DRILL CLAMP

The Poyser-Bucher Co., Canton, Ohio, have placed on the market a drill clamp and support, which is shown in the accompanying illustration. This clamp was designed to do away with the use of the gooseneck, or as it is called, the old man, and where is the mechanic who hasn't said things about the old man?

This clamp, by means of one adjustment, will drill a hole in the top, bottom, or web of an I beam, and as the photograph is self explanatory we need say nothing further.

## PORTABLE DRILL

The Wodack Electric Tool Corporation, Chicago, have developed a new automatic stop drill.

This portable drill is motor driven, using either alternating or direct current and automatically stops when not in use. This is due to the fact that the current contact functions through a spring lever in the handle which is released as soon as the pressure of the operator's grip is removed, much on the same order as the valve on a pneumatic hammer or on the same principle as the "dead man" grip controller used by the elevated railway system in Chicago.

This drill is the development of fifteen years of experiment and is made in six sizes: 3-16, 5-16, 3-8, 1-2, 5-8 two speed, and 3-4 inches.

In addition to the drill, this concern are manufacturing a portable grinder equipped with the same style of control. These grinders are made in three sizes, depending on the wheel capacity, 3x½, 4x1, and 8x1 inches.

## Know What You Burn

THE throwing of a quantity of magnesium (which had become hard and unfit for commercial use) into the furnace under the boiler in the plant of a Montreal concern resulted in an explosion that caused the death of one man and serious injury to three others.

Cases such as this one are seldom recorded in the annals of industrial hazard, but nevertheless, it exemplifies the great danger that lurks in the wake of the thoughtless or careless actions of persons indirectly responsible for the lives of many others, who, at stated periods, are more or less dependent on one or more men for the safety of their person.

Firemen and engineers in charge of boilers should have a greater sense of their responsibilities than was shown in this particular instance. While greater care must necessarily be exercised in burning the refuse around a chemical plant, the use of the furnace as a receptacle for all kinds of rubbish is a practice that should be strictly guarded against. Unless instructed by the man in charge of the furnace, no one other than the fireman should be permitted to throw any refuse upon the fire. Even though the rubbish be perfectly acceptable as fuel, the opening of the furnace door to throw the material in may result in greater loss than the heat units obtained from the stuff or the convenience of getting rid of it. In the case here cited, the slight damage to the building and the small number of injured persons, was doubtless due to the fact that the shock to the building was considerably lessened by the explosion wrecking the large skylight in the boiler room, thus preventing the full force of the concussion from coming on the more solid portions of the room. Had the boiler been more compact and bricked in, the result might have been more disastrous.

Where it is customary to burn refuse in a furnace the fireman should have full knowledge of what the rubbish consists of and if there is anything there that he has doubts of, it should be his duty to refrain from putting it on the fire. Where a boiler under pressure is concerned it is not well to "take a chance."

## The Other Firm

HAVE you heard this phrase any place? "I don't think it's time for us to buy yet," or "I don't think prices are right yet to go ahead with that undertaking."

Of course you have. In fact these twin phrases are becoming so common that they are going to be part of our business vocabulary.

If this attitude is maintained it may be found that it will be a very difficult matter to get started or to go on. The longer that the markets are left alone the harder will it be to get service.

It is time that we started thinking about the other man's business and interests a little. Would it do any particular harm, for instance, to stop and think some day that your business would be as good as a spring tonic now to the firm you were thinking of ordering from?

Suppose half a dozen firms, thinking of making purchases in the machine tool market, should drop in and remark that they were ready to go ahead now, believing that prices were fairly well on the way to a basis where they would stay for some time. Don't you suppose it would have an influence on the trade?

It is a dangerous thing to withhold your business too long.

Right now, by making a sacrifice to go ahead with some line of work, you are serving a double purpose. You are getting something necessary done and at the same time you are doing a good service to other lines of industry that need orders now.

It won't hurt you a bit to think a little about the interests of other people this year.

## The Strikes of the World

WE read of a little strike here and others there and to some extent we have seen the local waste of these movements. It is not often that a person has the opportunity of taking a world-wide view of the situation and getting some idea of the strike waste of the entire world for a given period.

Most of the figures given below are from the Manchester "Guardian," and although they cover the ground fairly well, there are no doubt many hours and days that could be added.

These figures are for the first six months of 1920:—

| Country— | Persons Affected | Days Lost |
|---|---|---|
| Germany | 1,866,358 | 18,201,660 |
| Italy | 1,781,250 | 21,650,200 |
| France | 1,186,670 | 19,358,400 |
| Great Britain | 1,117,040 | 6,926,900 |
| U.S.A. | 958,700 | 11,287,400 |
| Spain | 724,700 | 11,630,100 |
| Australia | 303,400 | 7,602,000 |
| Sweden | 180,070 | 4,779,170 |
| Belgium | 176,940 | 2,096,340 |
| Austria | 97,540 | 902,900 |
| Egypt | 95,000 | 441,000 |
| India | 90,000 | 1,780,000 |
| Poland | 81,000 | 429,900 |
| Switzerland | 73,380 | 2,753,160 |
| Holland | 63,000 | 795,300 |
| Argentina | 61,100 | 659,400 |
| Balkan States | 45,000 | 2,176,000 |
| South Africa | 41,000 | 809,000 |
| Denmark | 17,200 | 241,800 |
| Portugal | 13,150 | 235,050 |
| Czecho-Slovakia | 3,800 | 29,300 |
| Norway | 1,400 | 28,000 |
| Ireland | 100 | 2,000 |
| Total | 8,977,798 | 114,814,980 |
| **Industries—** | **Persons Affected** | **Days Lost** |
| Mining | 1,631,100 | 20,831,800 |
| Iron and metal | 1,377,830 | 20,791,850 |
| Textiles | 303,500 | 4,441,200 |
| Timber | 242,840 | 3,932,340 |
| Stone | 61,900 | 775,200 |
| Leather and paper | 40,080 | 624,620 |
| Building trades | 808,000 | 15,004,000 |
| Tailoring and cleaning | 160,500 | 2,467,300 |
| Food and luxury | 248,814 | 3,779,520 |
| Printing | 48,200 | 498,200 |
| Shipping | 1,540,174 | 17,454,050 |
| Chemicals | 269,900 | 5,566,800 |
| Steel | 184,110 | 1,072,560 |
| Agriculture | 1,975,800 | 16,819,000 |
| Unenumerated | 85,050 | 756,540 |
| Total | 8,977,798 | 114,814,980 |

# *The Fundamental Conditions Are Sound*

"ONE thing that has impressed me is the fact that buyers who are placing business now are taking advantage of discounts. They have the money at their disposal and I believe when they are satisfied that prices are right they will buy."

That is a report from the machine tool trade this week.

Another—One of the offices in the steel trade that handles a nice big tonnage every year reports a large number of inquiries, very few of which have been turned into orders. They are not being withdrawn, but they are going to be gone on with as soon as prices come within the estimate they have in mind on what the undertaking will stand.

Some of these inquiries are not new. They have been in the market before and are put in again now with the idea of finding out if there is any improvement in the situation.

But they come from a very wide range of industries. They call for structural shapes, bar mill products, sheets, ties, etc. The people asking for these prices are not concerned in the matter simply from the point of securing quotations for the sake of knowing market tendencies. They could get this information with much less effort.

They are following the markets because they have plans in mind, and they stand ready and prepared to launch them just as soon as they believe it will be to their advantage to do so. These inquiries represent definite future business and although an office may get a bit tired at times of nursing these along, the real salesman never discounts the importance of them.

Just this week Canadian Machinery asked W. H. Whitaker, of the Goold, Shapley & Muir Co., Brantford, if there was anything on the business horizon of his company that he could interpret as pointing to a more favorable business tendency.

Mr. Whitaker admits right at the start that it is quite a proposition "to give you optimistic material to sow broadcast in the hearts and minds of the general public, particularly to some person who is trying to sell the farmer something that he does not now need and which he seldom, if ever, buys in January and February."

On top of this, Mr. Whitaker seems to nurse an opinion that the farmers—perhaps through the U.F.O.—are engineering a buyers' strike. In other words they are not lugging home as many gas engines and windmills as they should.

But let it pass at that. When the Brantford manufacturer gets over his preliminary hurdles he has this to say:

"Even at that, our sales organization in Eastern Canada here did more business during the month of January, 1921, than we did in January, 1920. We are not blowing about it, because we did not do very much business in either period, but all these difficulties to the contrary, this Canada of ours is the best ever.

"The fundamental, underlying conditions for prosperity are sound and before 1921 lapses we are going to see, in the writer's judgment, a return to normal business and conditions, when, if we are industrious and thrifty, we are likely to be happy and some of us are going to be happy even in the meantime—and we all should be."

Another manager, speaking of this same condition, states his belief in the fact that "we have seen the worst. We can tell it in our own business. It may seem poor optimism to tell you that things are not getting any worse, but it is an absolute way of looking at the case. We do not deny that business is below normal, but we know from a close scrutiny of our records that the bottom of the hill has been reached. It is going to be slow going up for a while, but it is sure and certain. If there is any optimism of the worthwhile kind in that, you are welcome to it."

The cartoon on this page gives the idea. It is worth looking at. The traffic cop "Optimism and United Effort" can put his hand up and stop Old Man Gloom better than any other force that can be brought to the rescue and these forces can also take the hand of the rather timid chap "Business" and get him across the street in safety.

The more people who get out and get in behind that cop the bigger and stronger the officer will be and the less chance of the lad "Business" getting run over.

Now, then, let's get out and help that cop.

## THE NEW TRAFFIC COP

# MARKET DEVELOPMENTS

# Trade Quiet In Most of the Markets This Week

## Pittsburgh Reports Production Easing Off Even at Some of the Corporation Mills—New York Machine Tool Market Still Has Resales on Hand—Many Inquiries in Toronto District

THE machine tool markets are not making any rapid move toward recovery. Inquiries continue to hold first place over actual orders taken. Dealers report that some sales are being made and one of the signs they consider very encouraging is the way in which settlement is made for sales made. There seems to be enough capital to take advantage of all the discounts.

The exchange problems between various countries continue to be a source of bother, particularly as the machinery of several nations is finding its way to the Canadian market again after an absence of some years. The belief is expressed that there will continue to be a certain amount of instability until such time as arrangements are made to stabilize the value of the currency of the world.

The steel market is quieter than it has been for months. January was somewhat of a disappointment to the warehouses, although a large amount of material came into the country to actual orders. Some of this material has been on the books of the Steel Corporation for over 14 months and it is considered a favorable sign that it has stayed "good" all this time.

Steel merchants are concerned just now with getting rid of their surplus stock. They are drawing on their present stocks almost entirely. Some of the trade that should be good this time of year is being curtailed. Earlier in the season several firms send in orders for boiler tubes and have since cancelled or cut down, with the result that several yards have more tubes on hand than they had bargained for.

The scrap metal market remains inactive, but dealers generally look for a recovery in copper before the iron and steel varieties pick up, basing their belief on the ground that right now red and yellow metals are being sold for less money than it takes to produce them.

## MONTREAL TRADE SHOWS NO CHANGE—BUYING IS STILL SMALL

Special to CANADIAN MACHINERY.

MONTREAL,—Feb. 10, 1921. — Analyzing the present industrial situation brings out the fact that the physical features of business have changed but little, but the process of fusing the component factors is proceeding slowly, but surely. Business shows slight fluctuations, inasmuch as some plants are curtailing operations while others, particularly the smaller shops, are reporting better conditions and more work.

### Prices Steady on Light Demand

"There has been no change of late nor do we anticipate any marked departure from the present activity for some weeks or perhaps months." This impression of one dealer is, apparently, general among steel men throughout the district, although none of them seem disheartened over the prospect. As this particular dealer stated:—"Our business is quite satisfactory, and while we cannot say we are rushed with orders, we continue to do a steady trade from the warehouse, not heavy it is true, but in face of existing conditions there is little to complain of. There are very few in the steel business, to-day, that did not foresee such a time as the present, and there should not be many that are seriously put out by the temporary falling off in demand for steel commodities. This depression had to come and it will eventually prove to re-establish business on a saner and more healthy foundation." The feeling is still prevalent among many users of steel that lower prices will be a development of the spring business, and it is thought that the leading mill interests in the States hold the key to the situation, and if the Steel Corporation sees fit to readjust the wage scale, to provide lower selling figures, the general lowering of prices will be a logical consequence. There has been no price changes in the local market and those quoted are quite firm, even though business is not brisk.

### Exchange Absorption Quite General

"Inquiry is such as would lead one to believe that business is pending, but the actual sales resulting from these leads are relatively small." This is how one of the local dealers sized up the situation, and remarks of others are along the same lines. Some of the smaller dealers require to keep hustling to maintain business on a paying basis, but some of the larger houses report fairly good returns from salesmen's efforts, although the volume is not heavy. The supply end is most active but occasional placements for large tools are made. Hope was expressed that the railroads would be in the market for equipment, but this, apparently, has been deferred for some months. The absorption of the exchange or some part of it is now more general among American firms doing business in Canada.

### Buying Only What They Need

Dullness in old materials continues as a feature of present trading. Local dealers see little in current inquiry that would give the impression that the early future would see any marked improvement over past weeks. "We cannot say we are discouraged, although business is not sufficient to meet running expenses, but this period through which we are now passing had to come some time and the sooner we accept this the sooner will the time come when normal conditions will be resumed." The inactivity of many plants, particularly in the metal working industry, has reacted on scrap metals and the volume of business now carried on is exceptionally light. "The quoting of prices," said the dealer, "matters very little just now, as this factor seldom influences the trade. Material is acquired only when needed and they pay the price asked." Slight revisions, downwards, have been made in old material prices. The quotations, however, can only be considered as nominal.

# BELIEVE WORST HAS HAPPENED

### Inquiries Are Becoming More Numerous, but the Orders Are Not Being Closed

TORONTO.—There is this to be said, there is still money in the country. A machine-tool dealer mentioned this morning that he had made some sales during the month just closed, and when it came to terms and settlements he was surprised to find that in all cases they were ready to take advantage of all the discounts.

Those who study the markets closely, and take in all the conditions they can find, believe that the matter of international exchange has more to do with business than anything else. "We will have to arrive at some understanding before we can get very far in any one direction," was the opinion of a large dealer this week. "Now that other countries are getting in shape to put their products on this market we find that we are more or less at sea in figuring out where they stand in our money and what we can do to meet their prices. This tendency is likely to become worse instead of better."

Most of the houses that sell in this market have fairly large stocks on hand just now, and in that way are able to make very quick deliveries in almost any line that may be called for. In fact some of them have stocks on hand that are away and above anything previously carried.

Some of the offices report that inquiries are coming in more frequently, but they are not being turned into actual business at anything like the rate the dealers would like to see. The railroads have been buying very sparingly, considering the fact that general impressions led the trade to believe they would be in the market for good-sized lists.

Dealers do seem to agree on one thing, viz., that the worst has happened in the trade in this country, and from now on there should be some form of recovery, although they claim this is going to be more gradual than they had hoped for, and it may take some time before a normal amount of business is coming their way.

### In Small Amounts

Dealers in small tools are looking for something a little better after a number of firms have finished taking their annual inventories. Stocks have been allowed to run down without any replacement buying being done. One of the dealers claimed that it was becoming an obsession with some firms to buy from hand to mouth. There were fairly large concerns sending the boy down now for one or two drills of a certain size which they wanted to do some special job that had turned up. Hardware stores that carry small tools are doing the same thing and are drawing in small lots on the dealers rather than buy up a larger stock. Prices of small tools are unchanged.

Tool steels are easier in price, and shipment on English steels is very prompt. The English makers are preparing to make a bid for the Canadian market. One report this week tells of a small piece of very special steel being ordered and delivered in less than four weeks, and the claim is that this time is being made on a number of orders that are going over now.

### In the Steel Market

The average steel merchant is out to sell now, and not to buy. He is taking in small shipments of such lines as he may need, but in the main he is out to get his stock down. The past season has been a peculiar one, and the element of speculation entered more into the trading than ever before. Steel merchants had the option of buying in the spot market or doing without, and every time they took on a shipment of premium material they increased the element of speculation in their business, and the chances of getting caught with a loaded warehouse when the drop in prices came. Getting rid of stock is the big consideration just now. One of the dealers stated to Canadian Machinery this morning, "You can call it what you like, but as far as our own case is concerned we are trying to liquidate, and that word expresses it best of anything. Not that we have been caught overloaded, but we must get ready to do business on the new levels."

A case in point indicates how some of the firms have been waiting for deliveries from the Steel Corporation. At one of the warehouses this morning they were unloading small channels and angle iron that had been booked over fourteen months ago. The fact is that shipments of this can be had at comparatively short notice now, and it looks as though the corporation were out looking for business.

"One of the best features we find in connection with our business just now," stated another dealer, "is the way in which business has stayed sweet on our books waiting for delivery." This office reported that shipments of over a half million dollars worth of business had gone through in the month of January, and much of it had been waiting for months.

There are a number of inquiries in some of the steel offices, some of them for very fair tonnages, and representing a very wide range of operations. It is hard to tell exactly how much of this is going to be turned into real business, the dealers themselves believing that much of it is sent out to try out the market, and find whether there has been any improvement over a figure that may have been secured a few months ago. It indicates a willingness on the part of the buyers to come into the market when they consider that things have reached the proper stage.

Seasonable buying is not up to the old market in the steel trade this year. For instance, the boiler tube trade has been more or less of a disappointment. Firms earlier in the season gave fairly large orders for repair work, but since then they have cut their orders severely, and many warehouses are left with the goods on their hands.

### Scrap Market the Same

Nothing has developed to change the scrap metal situation. Prices are away down, but even so they are only nominal, and can hardly be put up as absolutely

## POINTS IN WEEK'S MARKETING NOTES

**Pig iron is now being quoted in Toronto district at $39.25 for No. 1. This price has been made necessary owing to the low prices quoted by the United States furnaces.**

**Material was being taken in at some of the Toronto warehouses this week that had been ordered from the United States Steel Corporation over fourteen months ago.**

**New York machine tool markets show very little improvement and a number of resale machines are still on the market there at quite a reduction from previous prices.**

**A large number of inquiries have been received by the steel trade in this district. Some of them undoubtedly are for the purpose of comparing present prices with quotations previously made.**

**There is no improvement in the scrap metal trade, although dealers look for an improvement in copper. They claim it is now being sold at a price below the cost of production.**

**Most of the steel merchants are engaged just now in getting rid of as much of their stock as possible, and are taking in very little material.**

**The sale of boiler tubes has been somewhat of a disappointment this year. Earlier in the season fairly large orders were placed, but these have since been curtailed considerably.**

**Some sales of pig iron have been made by United States producers at as low as $29 and there seems to be a move under way to force the price to $25.**

correct, because there is no trading, and trading is the one thing most necessary to establish a price. "We look to see reds and yellows coming back soon," was the view of one dealer this morning, "because right now coppers are selling below what it actually costs to make them. In other words, copper in ingots cannot be turned out at to-day's prices. On the other hand, iron and steel are still money makers and their sale price includes a margin of profit—in some cases a very good margin. Copper has had its bumps and is due to come back. That movement may start very shortly, although I am free to say there is nothing so far this week to indicate that recovery is near."

## PIG IRON SELLS NOW AT $39.25 TON

**Furnaces Still Working From Old Materials That Were All High-Cost**

Pig iron is now being quoted at $39.25 in Toronto—that is for No. 1 foundry. The last price was $43.65, and the price above that was over the $50 mark.

Working as they are from old materials the chances are that the makers of pig iron in Canada are not making much money out of the new price. They are using ore that came down last season and the same can be said of their coal and coke. Were they able to take advantage of present-day prices they would be able to go ahead on a much more satisfactory basis. For instance, the present price of Connellsville coke is around $5.50, while it is certain that Canadian stacks are melting with coke that has cost them well above that figure.

Pig iron is being sold on a smaller basis than usual. Firms are buying in 50-ton or car lots, and are not stocking for future usage.

## MANY RESALES ON NEW YORK MARKET

**Machine-Tool Trade Is Making a Slow Recovery in a Listless Market**

Special to Canadian Machinery

NEW YORK, Feb. 10.—The machine-tool industry is making a very slow recovery from the period of depression, which apparently has passed its worst stage. There has been for a few weeks a slight betterment both in inquiries and orders, but the total volume of orders being booked throughout the country is far from what might be termed a normal business.

Of course, the real reason for the failure of the machine-tool trade to pick up, as some expected it would about February 1, is that many manufacturers who use machine tools are still in that position where they have more shop equipment than they can keep busy. Moreover, the credit situation is not clearing up as readily as was hoped for, and on many of the current purchases time payments are asked for even though the total amount of the purchase does not run into large figures.

Much of the current business is in the nature of "bargains." Used machines and new machines offered for re-sale are being sold much more freely than are machines to be shipped from manufacturers' plants. Quite a number of brand new machines are on the market at prices at least 25 per cent. below those quoted by the machine-tool builders. Many of these machines were bought for export and the orders were cancelled before the machines left this country. In cases where the tool builders declined to accept cancellations the tools are being offered for sale.

While there is some improvement in the demand for tools, the closing of orders is still rather difficult. In this the competition of used tools and the re-sale of tools, mentioned above, is a factor.

Many machine-tool builders in this country are still carrying large inventories of raw materials, finished and unfinished parts, castings, etc., and the question of making reductions in selling prices to attract new business is of vital importance to them. Drastic reductions would cause some of these companies a loss too large to be borne; hence the hesitation about making price adjustments which buyers seem to expect without taking into consideration all of the facts.

## STEEL MILLS FINDING SOME OF THEIR COLLECTIONS VERY SLOW

Special to Canadian Machinery

PITTSBURGH, Feb. 10. — Production of pig iron is down to a rate of about 27,500,000 gross tons a year, this comparing with a rate of about 28,700,000 tons in January, 32,150,000 tons in December and 36,850,000 tons in the year 1920 as a whole.

Actual productive capacity may be estimated at 45,000,000 or 46,000,000 tons a year, so that the present rate of operation is about 60 per cent. of capacity. In one way this is a low rate, but it must be remembered that a number of times operations in the iron and steel industry have gotten down to 60 per cent., and merely in a time of ordinary depression or relaxation, without there being such great unsettlement in the world as now exists.

Just now there is no occasion to think of the rate of production increasing. There is no sign that it is going to do that in the near future, or until fundamental conditions have greatly improved. Rather the trend is very decidedly downward, and unless there is a complete reversal in affairs there will be a much lower rate in the course of the next two or three months. Very likely there will be some improvement in demand here and there, but the rate, as a total, will decrease. Only a small proportion of the merchant furnaces are now in blast, so that there is not much room left there for decrease. As to the furnaces of independent steel works, they are, as a whole, running a little better than the attendant steel works, so that there may easily be some decrease in that quarter. The great point, however, is the Steel Corporation, whose operations have been altogether phenomenal. The corporation is running about three times as great a proportion of its capacity as are the independents, and that, of course, cannot continue indefinitely. It is a marvelous thing that while four months ago the independents began to decrease production on account of the supply of specifications beginning to run thin, the corporation has in those four months operated at a higher rate than it did in the preceding four months. In December the Steel Corporation blew in five blast furnaces and blew out one, while in January it blew in two and blew out one, so that it is now running five more furnaces than at the close of November. At some time, and probably very soon, the Steel Corporation's production of pig iron and steel will begin to fall off sharply.

While the present rate of pig iron production, 27,500,000 tons a year, is only 60 per cent. of existing capacity, it is just equal to the output in 1910, which was 27,300,000 tons, while that was approximately the full capacity in 1910. There was sustained demand throughout the year, largely against old contracts. All the consuming industries were working well and requiring more iron and steel than ever before. Now there is not a consuming industry that is in anything like normal position.

### Prices

Foundry pig iron has been offered by producers on the basis of $29 valley, or $1 under the market as previously quoted. Nothing at all has occurred in Bessemer and basic, which accordingly remain quotable at $32 and $30, respectively, at valley furnaces. All these prices, however, are nominal. An actual inquiry for a few thousand tons would undoubtedly bring out lower quotations, but no one is disposed to inquire.

Pig iron is simply unsaleable. The furnace men do not know whether consumers would be interested at any price at all, but some of them would like to develop this matter. Production cost is, of course, vitally involved. With costs as at present the furnaces might shade these prices a trifle, but not much. The

furnaces have not much leeway now that the market has declined as far as it has already, most of the production cost being involved in the costs of the raw materials. Two or three of the coke operators, perhaps more, are alive to the situation and are desirous of co-operating with furnace men to get costs down, expressing their willingness to figure out coke prices afresh, even when regular contracts are in force, if the furnace men can get other items of cost down so as to make much lower prices for pig iron and try whether such prices will enable pig iron consumers to get started consuming.

With the exception of plates, prices of finished steel products are well held at the Industrial Board level. In several of the commodities there is some shading, but not a great deal. The steadiness of the market does not betoken any real strength in the situation, the cause of the steadiness being rather that there is so little inquiry of a regularly competitive character that producers are not encouraged to name cut prices. Plates have been sold at 2.50 cents, against the Industrial Board price of 2.65 cents, and more orders could be placed at 2.50 cents, though it is to be noted that the Steel Corporation and some of the independents are adhering strictly to the 2.65-cent price. Other commodities may be quoted at Industrial Board prices as follows: Bars, 2.35 cents; shapes, 2.45 cents; standard steel pipe, 57½ per cent. basing discount; plain wire, 3.25 cents; wire nails, $3.25; blue annealed sheets, 3.55 cents; black sheets, 4.35 cents; galvanized sheets, 5.70 cents; tin plate, $7 per base box, 100-pound.

**The Future**

At the beginning of the year there were some predictions that the demand for steel products would experience a marked improvement about the second half of March, and that there would be fairly full demand by September or October, though these predictions were not made universally. Now, however, the predictions are less hopeful. There are practically none who definitely predict full employment even late this year.

Several causes brought about this change in expectations. One is that the price readjustment is not proceeding as rapidly as was expected. Observers took their cue from the declines in certain quarters, assuming that others would follow, but now it is seen that the lead is not followed as was expected. To illustrate, long ago clothing experienced sharp reductions, but groceries are not down in proportion even now. The wholesale price of pork dropped below the pre-war price, but the retail price has undergone little reduction. Then, coming home to steel, the independent steel producers came down to the Steel Corporation or Industrial Board level before the end of last year, but the prices of many finished wares produced from the regular rolled products have not declined in proportion. In the past week chain has been reduced from 7.25 cents to 6.75 cents base, with a decrease in the extra for the smallest sizes of .75 cent, but chain is still high relative to its raw materials. wire at 3.25 cents, rods at $57 and bars at 2.35 cents.

Partly on account of this slowness in price readjustment the expectation of broadening in demand for steel must be deferred. Another influence is the unsatisfactory credit situation, capital being scarce and borrowing difficult. The steel industry, which usually does a cash business, with excellent collections, now finds collections very poor in some quarters.

# MEN EXPECT CHEAPER LIVING TO KEEP UP WITH THE LOWER WAGES

Sydney, N.S.—Two thousand four hundred men are employed daily at the steel plant, compared with four thousand when the full staff is engaged. Three mills are operating, plate, blooming and billet.

An official stated that no new orders had been received and the outlook was none too roseate. However, the company is seeking business and it may be that should nothing new be booked word may be received from Montreal to manufacture stock which would be kept on hand until called for.

Saturday saw the last day of the first week at the plant under the new wage scale, marking a cut of 20 per cent. on the wages of "all employees of the Dominion Iron and Steel Company," according to the circular posted on January 8. The big drop of one-fifth of the total earnings of the workmen has not yet been felt except through the partial idleness up to now. The first pay envelopes with the new wages will be distributed in the course of this week and a true expression of the effect can hardly be estimated yet.

Employees spoken to are strangely silent on the subject. They seem to have nothing to say but their attitude seems to be that they have to put up with the situation, the only alternative being idleness.

There is no one who seems to think that the wages he has received has provided him with a margin with which to meet the sudden severe cut in income, and the general expression is that unless the promised reduction in costs of living at once takes place, it means privation this winter. The workers do not pretend to be able to keep up present expenses with only the new rates of wages to see them through. They are hoping for relief.

# MAY ESTABLISH STEEL INDUSTRY ON THE PACIFIC COAST SOON

Establishment of a large iron and steel industry in British Columbia backed by British capital has been announced. A recent issue of the British Columbia Gazette carried the notice of the formation of the Coast Range Steel, Limited, with an authorized capitalization of $15,000,000. The promoters claim that within the next few years $50,000,000 will be spent in establishment of a great steel industry on the lower mainland of British Columbia. They expect to start active construction of the plant within six months. Five Vancouver men have been named as provisional directors.

Three years ago the British Columbia Government offered a bounty of $3 a ton on pig iron produced in that province from native ore. After investigating the standing of the interests behind the Coast Range Company, the B. C. Government passed an order in council sanctioning an agreement between the Minister of Mines and the company. The British engineers have been investigating the adequacy of raw material resources and they have evidently made a favorable recommendation to their principals.

The period of reconstruction will be three years, during which $15,000,000 will be spent, so the industry cannot avail itself of the provincial bounty until the end of that time. Meanwhile preliminary work is being pushed. The location of the plant has not been definitely decided, according to men interested in the project, but the lower mainland appears to be the likely district for the site.

Mr. Henry J. Landahl, of Vancouver, one of the principal directors, declared that the $3 bounty on pig iron was a great inducement for the British interests. "If we have resources of iron, coal and limestone in British Columbia in quantities large enough to maintain an iron and steel industry, and of such quality as to insure our successful competition with the world, then it is assured that all the money necessary to create this industry is available," said Mr. Landahl.

"We are optimistic enough to expect that the time will come when British Columbia will take care of the iron and steel trade around the Pacific."

---

**Open New Office.**—The Black & Decker Mfg. Co. have secured the services of A. J. Hopkins, who will act as their Canadian representative with offices at 392 St. James St., Montreal, Canada. Mr. Hopkins is well known to the automotive trade in Canada and is chairman of the Canadian Auxiliary of the Automotive Equipment Association.

# Two Novel Plans for Harnessing Niagara

By T. KENNARD THOMSON

THE report on a new plan, or rather two new plans, for securing power from Niagara, which is here given, s the work of an engineer of Canadian birth and training.

Mr. T. Kennard Thomson enjoys the honor of being the first Bachelor of Science in engineering to graduate from he University of Toronto. Following his graduation he was with the C. P. R. in construction work, and later went to New York to practise as a consulting engineer.

One of his greatest achievements was he building of the foundations for the Singer Building on Broadway at that ime the tallest building in the world. The fact that Mr. Thomson is a practical engineer, with a long and successful record in large undertakings, lends interest to the present scheme. The description of the plans in detail is given below.

Jan. 24, 1921.

To the Honorable Federal
Power Commission,
Washington, D. C.
Gentlemen:

We respectfully beg to submit that he greatest and most uniform and most needed water power resources n the world are in the Niagara River, and that we could obtain the maximum amount of power at the minimum of cost, from any further diversion of water from above the old Falls by our Goat Island plan, and that the best method of developing the maximum amount of power at the minimum of cost in the lower river is by an international dam at Foster's Flats, about 4 miles below the old falls.

While the Goat Island plan will be entirely within the United States, we believe that Canada would readily agree to an international development at that point, as it would obviously save money to the consumers on both sides of the line forever.

Our two projects do not interfere with any of the existing power companies in any way whatever.

Indeed, while we realize that the Governments should control the price for which the power will be sold, we realize the enterprise, the risk and capital which the five pioneer companies put into these original plants, and we therefore think that in fixing such prices, the pioneer companies should be allowed to charge a difference of say $10 a horsepower more than we do, if they so wish.

Neither Mr. Porter nor myself have any financial interest of any kind in any of the present companies.

We realize that no matter what power is sold for, it will always be worth what it cost to develop power by coal.

The cheapest power ever developed by coal in New York City before the war was by the New York Edison and New York Interborough, and it cost them an average of $32.19 a horsepower. That would be equivalent to $70 or $80 a horsepower in the State of New York now, and I was informed in December that it was then costing $90 a horsepower to develop by coal in Toronto.

We can develop two million horsepower at our new dam at Foster's Flats, at a cost of less than $100,000,000 or $50 a horsepower, and can do nearly as well at Goat Island. That means that we could sell for less than $10 a horsepower.

But, as there will never be enough water power to go around, if the manufacturers get our power at $10 or $15 a horsepower, they would have an unfair advantage over their competitors who had to pay $70 or $90 to develop power by coal.

The five pioneer companies developed 650,000 horsepower for $65,000,000 or $100 a horsepower. In doing this they attracted private capital to the extent of $650,000,000 or ten times what they spent themselves.

We claim, therefore, that it will be

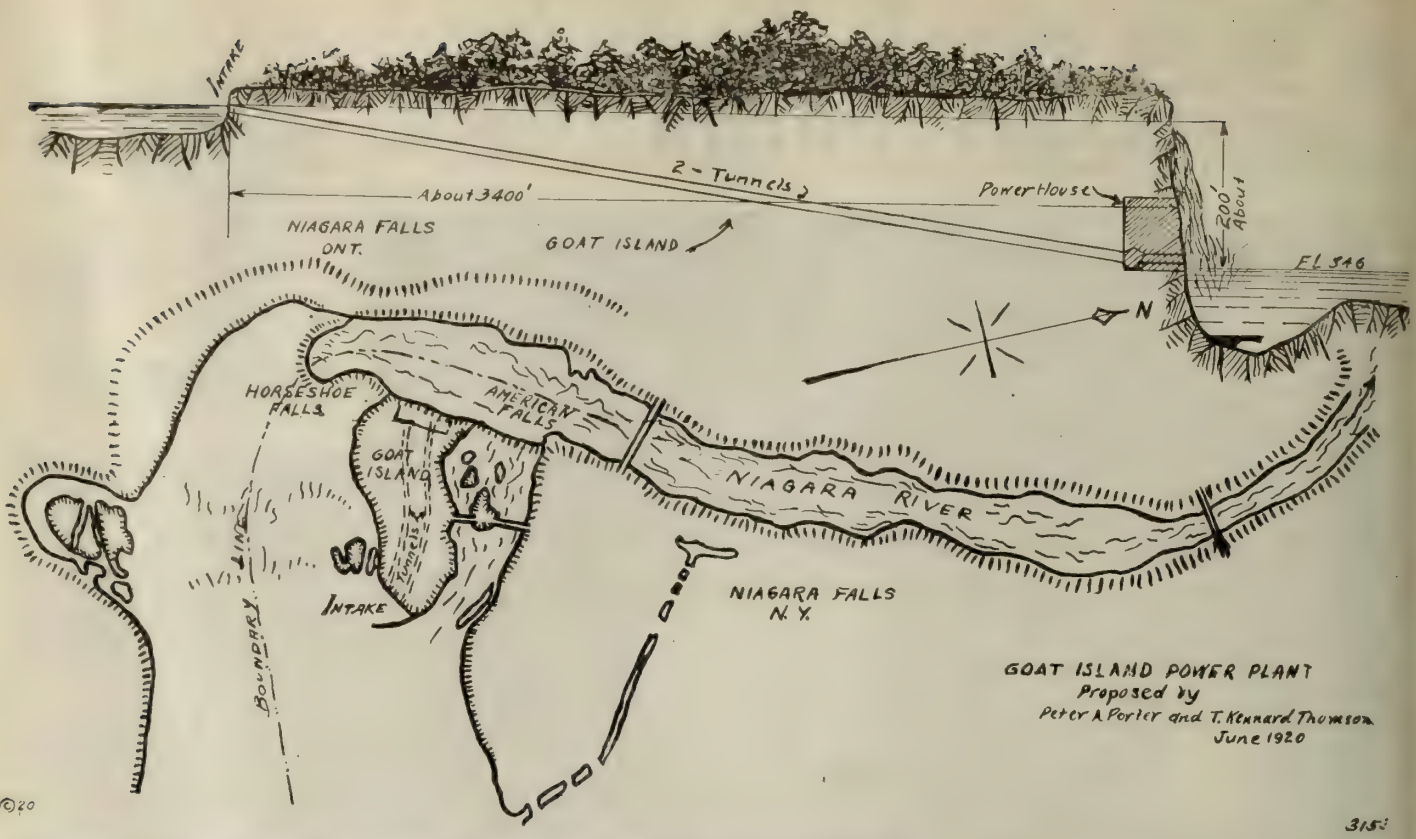
# A SIGN OF INCREASED PRODUCTION

## Every Shipment of Geometric Threading Machines Means Increased Production and Decreased Costs in the Shops Where They Are Consigned.

Small threaded parts are correctly duplicated in shortest possible time. These machines thread work which cannot be handled on the ordinary Screw Machine or produced economically in any other manner.

There are three sizes—½-inch, ¾-inch and 1½-inch. The threaded diameters range from ⅛-inch to 1½-inch inclusive.



Make Screw Thread Cutting the most satisfactory operation in your plant.

## TWO NOVEL PLANS FOR HARNESSING NIAGARA

Continued from page 57

very much better to allow us to develop power and sell it for use within 100 miles from the site, thereby building up the greatest manufacturing district in the world, than to try to distribute it at long distances with scattering results.

When first I started nearly ten years ago to agitate for this dam, people laughed at the idea that there would ever be a demand for 2,000,000 horsepower. In 1917 I wrote to the director of census, Hon. Samuel W. Rogers, asking him how much power was then in use in the State of New York, and what the normal rate of increase was. He sent me a very comprehensive reply, which summed up that we were then using over 3,000,000 horsepower a year in New York State and that the normal rate of increase was 10 per cent. or 300,000 a year. In other words, half of our dam which would go to the States would only supply one-third the amount of power then being used in the State of New York alone, or would only supply the additional demand for the next three years.

On the other hand I might state that Niagara power is now being distributed in Syracuse, 160 miles away, with a loss of less than 10 per cent. using a voltage of 60,000. By increasing this voltage to 110,000 the power is distributed on the Canadian side of the Detroit River about 250 miles. By doubling this voltage again, making it 220,000, the distance of transmission could again be doubled, making it 500 miles, with the same loss. By examining the enclosed diagram showing circles around Niagara Falls of 100, 200, 300, 400, and 500 miles, which area includes part of nineteen states of the Union and two provinces of Canada and contains 60 per cent. of the entire population of the United States and 80 per cent. of the entire population of Canada, it will be seen that all of these would then be within commercial reach of this power, although, as we have shown above, we would only have one-third the amount of power required by one state alone.

It might be stated that New York City alone uses between six and seven hundred thousand horsepower a year.

So the people on the frontier, especially in Canada, now realize that they want all the power that they can get developed.

Many people in Canada now realize that our proposed dam in Foster's Flats must be built sooner or later, and that when it is built, every cent spent on the Chippawa-Queenston Canal and similar diversions on either side of the River will have been so much money wasted, and I have not the slightest doubt that the Canadians will see the advisability of scrapping their canal, which I have been told is costing everywhere from $50,000,000 to $100,000,000 for the reason that no other plan or combination of plans will give within 1,000,000 horsepower as much as our dam will. And if Canada has half of that, it would be equivalent to 5,000,000 tons of coal a year at $10 a ton, making $50,000,000 a year. As soon as Canada is convinced, if she is not already convinced that she can get back the $50,000,000 a year, she will not hesitate to scrap the $100,000,000 plan if necessary.

As a matter of fact, however, it would not be necessary to scrap that or any of the other existing plants until they were worn out, but as our two projects are capable of using all the permissible water, such side issues simply add to the cost to the consumer forever. I have taken the liberty, Gentlemen, of going into such detail in the hope that you will not allow further partial developments on this side of the line, to thus add to the cost forever.

In addition, not only would such diversions greatly add to the cost forever, but, we are quite confident that any further diversion of water from the Rapids would result in an ice jam, which would probably destroy every plant in the River. My reason for this statement is that there is hardly enough water now going over the rocks in the Rapids to carry the ice away. As a proof of this statement; some dozen years ago, an ice jam was formed in the Rapids which only lasted eight hours, and kept the water back until it had done considerable damage to the power plants at the Falls, although such plants were at an elevation full 60 feet above the level of the water where the jam occurred, and when the jam broke, absolutely destroyed everything in the river below, all the way down to Lake Ontario for a height of over 20 or 30 feet above the original water level: wharfs, docks, trees, shrubs, buildings and everything being swept away. This jam was caused by a slight change in the wind at Buffalo, which held back the water for a short time, letting the ice pile up on the rocks in the Rapids.

An engineer making as drastic a statement as this should give more than one example. So I go back probably some

*If interested tear out this page and place with letters to be answered.*

millions of years, when an ice jam probably diverted the Niagara River, causing it to turn a right angle thereby forming the whirlpool, cutting the brand new channel through the bed-rock.

By looking at the plan, it will be seen what an ideal location Foster's Flats is for the dam, for we can build the first part of the dam on dry land, carrying the base of the dam some 30 feet or more below the bed of the river and then divert the entire river through temporary openings at the bottom of the completed section of the dam, making it a comparatively simply matter then to dam the present channel of the river.

As we propose a dam with very flat slopes, about 700 feet base, it will be a very simple matter to handle the ice, as there will be nothing to prevent the ice from going right over the top of the dam, as there will be no sheer drop on the down stream side of the dam to undermine it, the ice simply sliding off on the flat incline. This design has been called a submerged weir. There will be a minimum depth of 135 feet above the dam and minimum flow of about 220,000 cubic feet per second, so there will be no obstruction arising from the ice.

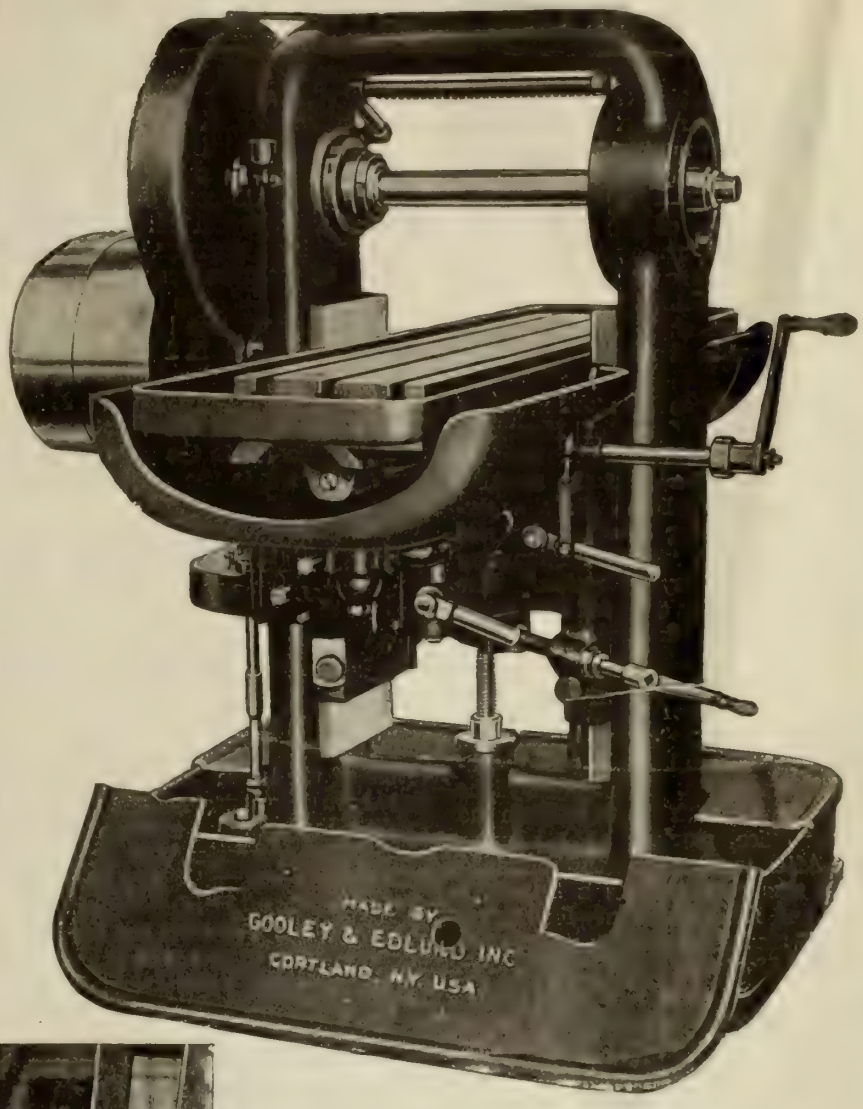
### Goat Island Plan

A glance at the plan will show an inclined tunnel of 2500 feet. It does not need any engineering figures to prove that such a tunnel is cheaper than tunnels five or six miles long or the Chippawa-Queenston Canal which is 12 3-4 miles long. Furthermore, we do not lose the valuable head which, in case of the Chippawa-Queenston Canal, amounts to 16 feet. This tunnel can of course be extended far enough above Goat Island to take advantage of the entire head of the river, at and just above, the old falls, and furthermore it does not destroy any property or scenic beauty on Goat Island whatever.

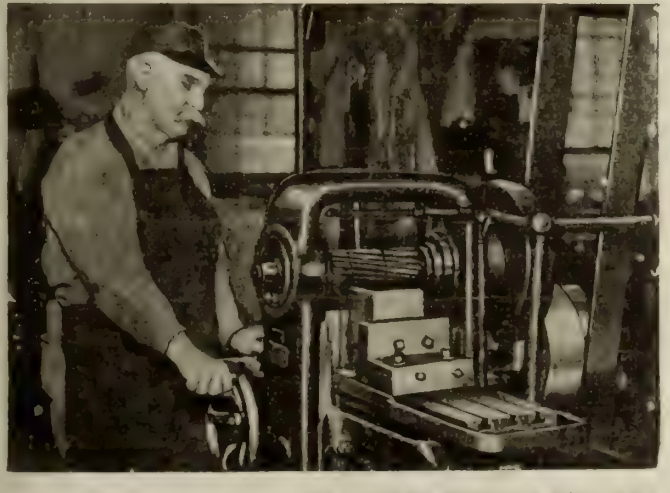
These two projects together could develop about 4,000,000 horsepower a year, every ounce of which could be readily sold and it would be far better to sell it at the site, thereby developing great manufacturing centres and to pay enormous taxes to Canada and the States, so that all would derive equal benefits instead of taxing all for the benefit of a few.

At the same time the matter of canalization, and power, of the St. Lawrence River should also be started. While it is true that the bulk of the power of the St. Lawrence River belongs to Canada, the United States will benefit enormously by the canalization of the St. Lawrence River, as well indirectly from the development of the power.

For the development of 4,000,000 horsepower in the St. Lawrence River, and 4,000,000 horsepower in the Niagara River, or 8,000,000 horsepower together, or to be conservative say 6,000,000, which is equivalent to 6 million tons of coal a year, will mean that there will be ten Pittsburghs on the frontier. Such developments could not fail to benefit every town, village, and city in the United States and Canada. As a matter of fact, the United States will probably benefit by a 30-foot draft from Montreal to the Great Lakes to a much larger extent than Canada, as our country already has free use of the Canadian canals, and I have been informed often make more use of them than the Canadians. The profile will show that there are five lifts in the St. Lawrence River between Montreal and Lake Ontario, and these might possibly be cut down to 3 or 4.



If the United States and Canada will get together and give us the rights to develop this power, we will give a 30-foot draft to the Great Lakes without charge to either government, and we will develop power, under government supervision as to the plans, construction, operation, taxes, selling price of power and our remuneration.



If this work were done by government ownership in the old sense of the word, God help the countries! On the other hand, it will be inconceivable to give a private monopoly worth $600,000,000 or so a year to any individuals. But if the

# The Week's Events in Montreal Industry

The Dominion Bridge Co. are remodelling a snow-plow for the city of Montreal West. The power is obtained by means of a caterpillar tractor.

---

A. M. Wiseman, of the staff of the British Trade Commissioner for Canada, in Montreal, has been removed to Ste. Anne de Bellevue Military Hospital near Montreal to undergo treatment for wounds received in the war.

---

At the regular monthly meeting of the Canadian Railway Club, of Montreal, held at the Windsor Hotel on the evening of the 8th, the feature of the meeting was the address by D. E. Blair, superintendent of rolling stock, Montreal Tramways Co., on "Some Engineering Features of Tramway Operation." The meeting was largely attended and many new members were admitted.

---

H. J. Dalton, who has been assistant auditor of agencies of the Canadian Pacific for the past eight years, has been appointed to succeed E. E. Lloyd as auditor of disbursements. Like Mr. Lloyd, he first saw service with the C. P. R. in the Winnipeg office, starting as a junior clerk. After two years in the Winnipeg office he was appointed as a travelling auditor, and for over twenty-four years was chief travelling auditor with headquarters at Montreal.

---

A very enjoyable evening was spent last Saturday by the staff members of the Montreal branch of the Canadian Fairbanks Co. and their friends, when a dance was given by the employees of the company. The patrons and patronesses were: C. J. Brittain, vice-president and general sales manager, and Mrs. Brittain; H. B. Walker, controller, and Mrs. Walker; and H. V. Cordell, manager, and Mrs. Cordell.

---

Escher Wyss & Co. have recently reorganized their Canadian organization. Mr. Th. Seidl, after an absence of several years, again returns to take charge of the Canadian business, and C. H. Withers, who has been looking after the business since 1917, will remain with the firm as assistant manager. The company manufacture large water turbines and hydraulic equipment; they also handle the lines of Messrs. Buhler Bros., of Uzwyl, Switzerland, makers of cement mills, brickworks, automatic elevators, and other specialties.

---

J. H. Trudell, of Montreal, has recently developed a new automatic train connector, and he has several constructed and installed at the plant of the Montreal General Tool Co. of Montreal for demonstrating purposes. The outstanding feature of the apparatus is the total absence of gaskets, the joints being metal to metal face, and the well-known rubber hose in the old connector has been replaced by an all-metal connection made of standard pipe and ball joints. A company has been organized for the manufacture of these devices.

---

Announcement has been made of the appointment of E. E. Lloyd to the position of assistant comptroller of the C. P. R. He succeeds the late W. J. Moule. Mr. Lloyd entered the services of the Canadian Pacific in the year 1887, starting as a clerk in the stores department in Winnipeg, and ten years later was appointed chief clerk in the stores department at Vancouver, remaining there until 1903, when he was transferred to the Montreal office of the same department and in the same capacity as chief clerk. In 1904 he was promoted to the office of chief clerk in the auditing of stores and mechanical accounts, and seven years later was elevated to the position of assistant auditor. In 1913 he was appointed auditor in the same department, and in 1918 he was promoted to auditor of disbursements, a position he held until his recent appointment to assistant comptroller.

## BRITISH FIRMS ARE GETTING IN SHAPE FOR EXPORT TRADE

The Department of Overseas Trade in Toronto furnishes the following information to Canadian Machinery regarding conditions in Britain:

With the reduction to more normal levels of the heavy home demand which has been the outstanding feature of trade since the war, manufacturers are showing an increasingly marked interest in overseas orders. The response to announcements by the Department of Overseas Trade of calls for tenders has become very gratifying, and the measure of interest now being taken is equally demonstrated by the numbers of visits to the department from representatives of all classes of firms seeking possible openings or general reports on overseas market conditions. The result is that very important foreign and colonial orders have recently been secured by United Kingdom firms, and that strong competition is being put up for others.

Although prices are still high, determined efforts are being made, with considerable success, to reduce them by improved organization, elimination of unnecessary human labor, standardization, massed production, and the increased employment of automatic plant. A noticeable result of these steps is that many firms have now been able to set aside small stocks, and, in addition to offering certain reductions in price, they can make firm quotations and give immediate delivery. This is especially the case in certain branches of machine tools, agricultural machinery, and gas and oil engine trades. Many firms whose order books are too full to permit of collecting stock, have made arrangements whereby certain percentages of their output are available for export.

Locomotive manufacturers, although for the most part still having good orders on their books or under execution, are prepared to consider others, and to begin building, in some cases, immediately. Delivery can generally commence about seven months after receipt of order. As an indication of ruling prices, first-class main line locomotives for passenger traffic range between £15,000 and £17,000, according to specification, and heavy goods locomotives from £11,000 upwards. One or two firms have actually stocks ready for delivery, especially of the industrial type, and a recent advertisement of one of the large firms shows that it could deliver a miscellaneous lot of 130 at once. With the growing improvement of the Scarab oil-burning installation, locomotives can easily be converted to use this fuel.

Wagon and carriage builders are quite busy, but practically all are able to look at new orders. Stocks are available in some cases, but for special requirements delivery can be made in anything about two months from receipt of order in the case of wagons, and in five to six months in the case of coaches.

Rails, except in standard sections, are scarcely to be had from manufacturerers in anything under eight months. Some merchants have good stocks of home rails, and recently have quoted for and secured large orders for immediate delivery.

General contractors for road, railway, dock, and other public works schemes have increased their plant and staffs and improved their organizations, and are in a favorable position to put up strong competition where financial guarantees are forthcoming. There are, however, many local schemes in hand, or under consideration, and for the most part it would appear that firms are open to consider only large contracts which would justify the expense and trouble of preparing plans, and sending out plant and staffs, and which would provide work for a considerable period. In order to secure their interest very full particulars,

## RATES FOR CLASSIFIED ADVERTISING

Rates (payable in advance): Two cents per word. Count five words when box number is required. Each figure counts as one word. Minimum order $1.00. Display rates on application.

including plans, specifications, and terms of payment, should accompany the notification of any such schemes open to tender. Factory plant, especially machine tools, woodworking machinery, tin-making equipment, food treating and preparing plant, including baking and confectionery machinery, printing machinery, etc., is comparatively plentiful, and, for many classes of these orders can be filled fairly promptly. Textile and chemical machinery trades are heavily committed, and, except in some of the smaller lines, considerable time would be required for delivery.

A number of comparatively new British lines are barbed wire and nail making machinery, concrete block making machines, automatic machinery for the manufacture of piano wrest pins, which were formerly made in Germany only, thrust boring plant, wave-power transmission tools, mechanical pickers, magnetic ore separators, etc.

The coal strike has been responsible, it is true, for the temporary partial closing of many concerns, and customers who desire their plant made to order will, no doubt, as a result, have to wait longer for delivery, especially in the case of heavier plant. It is, however, expected that within a short period the effects of the crisis will generally have passed and conditions will have become more normal.

## Trade Gossip

A pipe shop is being erected by Crane, Ltd., 83 Terauley St., Toronto.

The United Drug Co., 78 Broadview Ave., are building a $60,000 warehouse.

A $60,000 factory is being erected by the Decalcomania Co. of Canada, Ltd., 364 Richmond St., Toronto.

Tenders will be called shortly for erection of cold storage plant for Devine & Son, 394 Queen Street West.

A new foundry is being erected at a cost of $75,000 on Broad St., Ottawa, by the Beach Foundry Company.

A public garage is being planned by George Buschlen, Parkway Ave., to be erected on Queen St., Toronto.

The plant of the National Steel Car Company, Hamilton, Canada, will be closed for an indefinite period for stock taking.

The National Engineering Company, Limited, of Sarnia, Ont., are adding disc wheels to their list of products in the near future.

A thirty-acre site has been purchased by the Anglo-American Motors, Ltd., at Mimico, Ont., and a factory in ten units will be started shortly.

The first factory of its kind in Western Canada, the Britannia Wire Rope Company, Limited, commenced production at Vancouver recently. It is an all-British concern.

The Huron Specialty Castings Company, Clinton, Ont., will move to Goderich when their plant, which is now being constructed there, is completed.

The Dominion Bridge Co., Lachine Que., have received the steel contract for extension to factory at a cost of $50,000 for Standard Paint Co. of Canada, Ltd. 52 Victoria Square, Montreal.

It is reported that the executive offices of the International Harvester Co., Ltd. of Canada, are being removed from Chicago, Ill., to Hamilton, Canada, where the Canadian plant has been located for several years.

The Brantford Computing Scale Company, Limited, have acquired the Kerr & Goodwin plant in West Brantford, and will move their business there. Additions will be made to take care of the large volume of foreign business offered.

A new industry is to be started at Walkerton shortly, the Sterling Twine Company, Limited, who expect to be in operation some time this month. They will manufacture all kinds of commercial twines of various sizes, grades and qualities.

The Canadian Perfect Wheels, Limited, a recently incorporated company at Listowel, Ont., are remodelling their plant to the requirements of the modern wheel factory. They expect to be manufacturing in April and will produce automobile wheels, disc, wire and wood, and a general line of accessories, stamped work, etc.

### TWO NOVEL PLANS FOR HARNESSING NIAGARA

Continued from page 62

governments will give us the rights as above indicated, on the basis that we get so much remuneration if we develop power for say $15 a horsepower, less if it costs more than $15 a horsepower and much more for every dollar saved below $15, we would have all of the incentives of a private ownership without any of the objectionable features.

We therefore beg of you, Gentlemen, that you give us permission to develop the Goat Island plan, and that we also beg of you to arrange for an international agreement, treating the entire question as one unit, thereby saving untold millions to the future generations for they will undoubtedly have to pay not only for our two proposed projects in the future, but also for any and all of the minor diversions such as the Chippawa-Queenston Canal or tunnels on either side of the river.

We therefore respectfully state that we think you have it in your power to create the greatest industrial centres in the world, the results of which would be so far reaching that there is scarcely a country in the world that would not be benefited.

Respectfully submitted,

(Signd.) T. Kennard Thomson.

## Personals

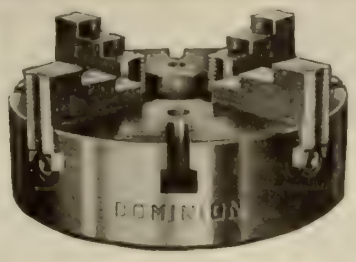
. C. Crow, sales manager, the Can- a Metal Company, Limited, Toronto, is making a business trip to the coast. H will be away about a month and will spend some time at the Winnipeg and V couver plants.

L. Clark, president and manager of P fect Machine Company, Galt, an ag- ssive booster, has been chosen as p sident of Galt Board of Trade. Al- dy plans are being discussed for a p gressive year.

. M. R. Fairbairn, who has just been ected president of the Engineering In- tute of Canada, was born in Peterboro 1873 and has attained a premier posi- n in the engineering world. After a rse at the School of Practical Science . Fairbairn went first as an assistant the Department of the Interior, when became engineer in charge of con- uction of the Montreal Park and Is- d Railway. In 1900 he joined the con- uction department of the C. P. R. and years later was raised to the post of sistant chief engineer, while in 1918 was appointed chief engineer of the P. R. Other officers elected were: ssrs. H. G. Acres and W. J. Francis, vice-presidents. The following were cted as councillors: F. P. Sherwood d K. B. Thornton, Montreal; S. S. iver, Quebec; G. B. Dodge, Ottawa; C. Kirby, St. John, N.B.; Prof. C. R. ung, University of Toronto; R. Dob- n, Peterboro; A. C. D. Blanchard, Niag- a Falls; H. B. R. Craig, Windsor; W. . Scott, Winnipeg; H. S. Carpenter, Re- na; S. G. Porter, Lethbridge, and H. L. hnston, Armstrong, B.C.

## Catalogues

### NEW CIRCULAR



The Oliver Instrument Co., Adrian, Mich., ave issued a circular illustrating and scribing their sawing, filing, and lapping achine. The literature shows how these achines can be used for sawing and fil- g articles from carbon, bakelite, card- oard, fibre, soft and hard rubber and ather. This, of course, in addition to s regular metal working uses.

### INTERESTING BOOK

The Taylor Instrument Co., Rochester, Y., have issued a very attractive Jan- ary issue of The Tycos-Rochester. This s a little book devoted to things scientific, nd, of course, deals more or less with yco equipment. It proves interesting eading, however, apart from its trade lavor.

### TOOL AND SPECIAL STEELS

The Vulcan Crucible Steel Co., Aliquip- a, Pa., have issued a catalogue on tool teels and special steels. This book not nly shows the classes and types of steels manufactured, but includes photographs howing the plant, equipment, etc. Some ery valuable information to those in- erested in steels also forms a part of this nteresting booklet.

# DOMINION CHUCKS

STEEL OR CAST-IRON BODY
BUILT FOR HEAVY DUTY

## All Screws Are Reversible

SCREWS are made of the best grade steel. Both ends are broached and are heat treated after machining. They are reversible, so that either end may be used, are large enough in diameter to stand the torsional strains applied by operator when setting up his work. They are made to give the best service—and may be depended upon to stand up under the hardest usage.

DOMINION STEEL PRODUCTS CO. LIMITED
*Engineers • Manufacturers*
BRANTFORD, CANADA

### INTERESTING CATALOGUE

The Mason Regulator and Engineering Co., Ltd., Montreal, P.Q., have issued a new catalogue of their products. Every means of condensing the information has been adopted and the data have been made short and concise as possible. In other words it is a condensed catalogue. Should a reader of the book desire further information he is told how to secure it from the larger specialized catalogues published by this firm.

### CRANE CATALOGUE

The Herbert Morris Crane and Hoist Co., Ltd., have sent us a copy of their catalogue, No. 76. This book is of the loose-leaf type and contains some valuable data on crane installations. Chain blocks of various types are shown, and illustrations of different uses for the same are scattered throughout the pages. These cover practically all industries and are in themselves a lesson on the use of chain blocks.

Different types of trolleys and I beam runways are next given, these also being well illustrated from actual installations. Hand operated overhead cranes, overhead travelling cranes, travelling gantry cranes, jib cranes, ash hoists, barrel slings, motor driven trolley hoists and motor operated electric cranes are also shown, each style of equipment being illustrated in actual use. This book is actually a handbook on cranes in general.

### GRINDER CATALOGUE

The Blanchard Machine Co., Cambridge, Mass., have issued a new catalogue, No. 16, dealing with their high power vertical surface grinder, and this book supersedes all earlier editions. The various types of drives are shown by illustration, and examples of work machined by their grinders is depicted. This is followed by a general description of the machines, together with specifications, etc. Their magnetic chucks are also discussed, together with the continuous reading caliper attachment as used on their machines.

### CHUCK CATALOGUE

The Skinner Chuck Co., New Britain, Conn., have issued a new catalogue dealing with their line of chucks. This booklet is called "Chucks and Their Uses" and starts off by telling a story of the origin of chucks. The use and care of modern chucks is then gone into. A list of dont's concludes the contents of this interesting booklet and mechanics in general should read these don'ts as they happen almost every day and are points easily avoided.

### NEW CATALOGUE OF LATHE CHUCKS

The Cushman Chuck Company, of Hartford, Connecticut, have prepared a new catalogue for 1921. For several years past their catalogues have been practically re-issues of one that was prepared in 1914, only with the exception that the 1914 list prices were revised in 1917.

There are many pages with useful information for all who have occasion to use lathe chucks, and parts of such are arranged under the following headings: Outfits for lathes; How to increase the efficiency of lathe chucks and prolong their usefulness; how chucks are attached to lathes; dimensions of intermediate flange plates; repairs and replacement parts.

### NEW CATALOGUE

The Hanson Clutch and Machinery Co., Tiffin, Ohio, have issued a new general catalogue C 3. This booklet is intended as a handy reference for anyone using or contemplating using friction clutches. The application of their clutches is shown.

# Classified Opportunities

## MACHINE WORK WANTED

MACHINE WORK WANTED FOR LATHES, shapers, milling machine and planer, etc. Hourly or contract basis. Prompt delivery. W. H. Sumbling Machinery Co., Toronto. (ctfm)

## POSITIONS WANTED

DRAUGHTSMAN (PERTH COUNTY) DESIRES change. Have had general experience of ten years. Am first-class practical shop mechanic, age 30. Married. If you are in need of a young man of ability, who has risen by merit only, let us arrange an interview. Address Box 747, Canadian Machinery. (c6m)

## AGENCIES WANTED

SOLE AGENCIES WANTED BY WELL-known, reputable and established English engineering firm, represented all over the world, for Contractors' or Municipalities' small Engineering equipment, which must be first-class, competitive in price, and in constant large demand. British made and patented preferred; if Colonial or Foreign, privilege or manufacturing in England required. Big sales assured for the right Equipment. Write giving details to "Engineering," P.O. Box 1934, Montreal. (c8m)

## MACHINERY WANTED

WANTED—NEW AND RE-MANUFACTURED gas and gasoline engines, boilers, saw-mill machinery, planing mill and sash and door factory machinery. New and manufactured iron and wood-working machinery. Electric motors, dynamos, direct connected steam operated generators, portable electric tools. Builders' hoists, elevators. Box 739F, Canadian Machinery.

IF YOU HAVE IRON-WORKING OR WOOD-working machines for sale, or idle machine shop equipment, call or write Canada's largest dealers in new and used machinery. H. W. Petrie Limited, Toronto, Ont. (cfm)

WANTED — WOODWORKING MACHINERY and mining machinery, machine tools, boilers and steam pumps, alternating or direct current motors. Contractors' equipment. Apply Box 737F, Canadian Machinery.

PARTIAL LIST

**Machine Shop Equipment**

***At Extremely Low Prices***

LATHES—All sizes and lengths of bed. Special price quoted on rebuilt 20 in. x 8 ft. C.M.C.

AIR COMPRESSOR—8 in. x 8 in. Chicago Pneumatic.

TANKS—10 Tanks 10 ft. 6 in. diam. x 29 ft. 6 in. long. 19,000 gals.
3 Tanks, 10 ft. 0 in. diam. x 39 ft. 0 in. long, ⅜ in. Heads. 22,893 gals.
Full line of other Steel Storage Tanks, open and closed, all sizes.

PUMPS—1 Triplex Power Pump, 1½ in. x 6 in. Hydraulic Machy. Co. Also 1 in. x 5 in. West Tire Setter.
1—Centrifugal Pump, 2½ in. x 1½ in. Gould.
1—Gould Triplex Power Pump, 2 in. x 3 in.

Milling Cutters and Reamers, full assortment, all sizes and shapes, at less than half price. Send us your enquiries.

## Would You Like to make some Extra Money?

Of course you would. Well then, why not do so? Canadian Machinery is always on the lookout for well-worth-while ideas, and are willing to pay a good price for them.

We are often asked, "What sort of ideas do you want?" Briefly, what we are desirous of obtaining is this, "Any idea that has proved of value in the machine shop, drafting room, or tool room." Think of how you got over some difficulty, a ticklish piece to hold in the lathe, or perhaps how you increased production on some particular piece. Any idea that saves time or money in the machine industry will appeal to us. Never mind the style. Write it as best you know how. We will put the finishing touches to both the wording and the sketch. Start in **NOW** and send us something of such a nature.

# Of Interest to Every Canadian

*Number One of a Series of Advertisements*

Efficient service is the keynote of membership of

## *Canadian Machinery*

—IN—

## Canadian National Newspapers and Periodicals Association

—a highly constructive service—absolutely dependable and devoid of prejudice and personal bias. It means much to you!

The policies and principles back of this important service enable you to secure practical and impartial information of great value in business and in the home: and they assure a ready fund of literature of exceptionally high standard at all times.

To read the Association's Standards of Practice listed herewith is to understand what this Association means to you.

### Standards of Practice

**Canadian National Newspapers and Periodicals Association**

THE Members of this Association shall dedicate their best efforts to the cause of business, and public service, and to this end shall pledge themselves:

1. To consider first the interests of the Subscriber.
2. To work for truth and honesty in all departments.
3. To eliminate, in so far as possible, their personal opinions from their news columns, but be leaders in thought in their editorial columns, and make their criticisms constructive.
4. To refuse to publish puffs, free reading notices, or paid write-ups, to keep their reading columns independent of advertising considerations, and to measure all news by the standard "Is it real news?"
5. To decline any advertisement which has a tendency to mislead, or which does not conform to business integrity.
6. To solicit subscriptions and advertising solely upon the merits of the publication.
7. To supply advertisers with full information regarding character and extent of circulation, including detailed circulation statements, subject to proper authentic verification.
8. To co-operate with all organizations and individuals engaged in creative advertising work.
9. To avoid unfair competition.
10. To determine what is the highest and largest function in the field which they serve, and then to strive, in every legitimate way, to promote that function.

This is Number One of a series of advertisements regarding an Association that typifies thorough-going Canadian stability. Read the forthcoming advertisements in the Magazines, and Agricultural, Business, Religious and Educational newspapers, and Technical newspapers.

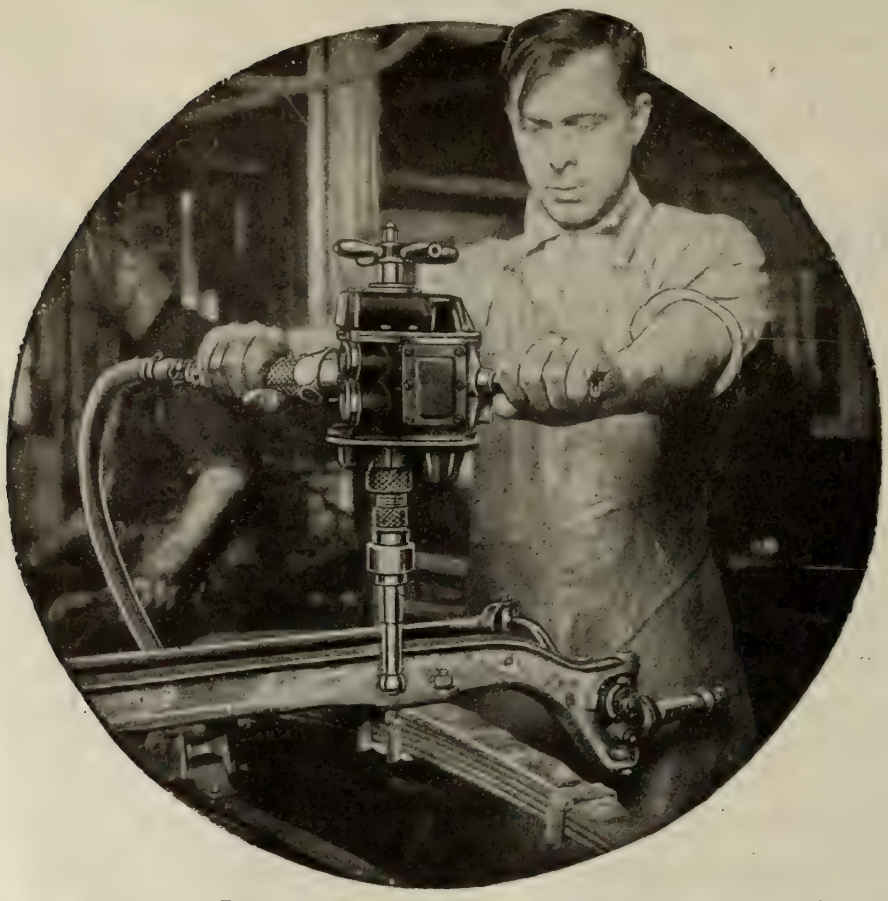
# Money Saving Information

"The most useful information contained in any paper I get"—so a Western banker writes in to-day's mail, renewing his subscription for FINANCIAL POST.

"Very often," his letter goes on to say, "I am called on to suggest investments for small amounts, sometimes as low as a few hundreds, and I find your Investors' Inquiry Service a reliable partner to consult. If every investor knew there was such a service at his call it would surely lessen the losses of many of these people."

The Investors' Inquiry Service fills just that need. Unless you are perfectly sure of your investments, write us before you buy.



It costs FINANCIAL POST subscribers nothing to be sure before placing hard-earned savings in stocks that may never have a chance of paying dividends.

Trained service men will give you the benefit of keen analysis based on the facts behind the securities you are considering. This is one of many features enjoyed by our readers.

# *Piece workers prefer Little Giants*

BECAUSE "they can push them harder and earn more."

Piece workers demand the speediest drill manufactured; the foreman of the assembly shop requires both maximum output and quality work.

Good reasons why Little Giant Air Drills are now standard in hundreds of shops and plants.

Another reason—the toggles of Little Giants are equipped with quickly *renewable* bearings. No need to scrap an entire toggle because of a minor worn part.

Little Giants are ready to stand comparative test in *your* plant and become *your* standard drill. Prompt delivery can be secured from the Company Branches listed below.

THE Hendey reputation is a big thing to consider when buying machine tools.

Take for example the Hendey Universal Milling Machine in the plant of the American Stay Company. As you see, it is cutting spiral gear teeth on a shuttle. The company expresses entire satisfaction with the service they are securing.

**Many are the excellent features of the Hendey Miller. The main spindle has taper journals which run in annular bearings. All feeds are automatic and can be operated simultaneously and reversed while the machine is in motion. The table is deep and rigid.**

HENDEY

# *They have a STANDARD*

# *How about YOU?*

Johansson
ACCURACY

When business men wish to keep an appointment they set their watches by the same standard clock. They will then be sure to meet without wasting any valuable time. Not only would a business man be at a loss without his watch, but unless he had a standard by which to keep that watch accurate, he would be greatly handicapped throughout his busy day.

A micrometer is to the mechanic what a watch is to a business man. Unless mechanics have some accurate standard of measurement however, for constantly checking their measuring instruments, close accuracy cannot be depended upon. A set of Johansson Gages serves as an acknowledged standard on which mechanics can absolutely rely. Several sets in different parts of the shop insure greater accuracy in the plant.

# 26" x 46" x 12' Quick Change Gear Gap Lathe

A general purpose lathe, one that will work efficiently on a single operation all the time, but is especially suited to doing a variety of work, as its construction permits of handling jobs varying greatly in size and changing from one to another with the minimum loss of time.

The feeds and screw cutting changes are instantly obtainable by the movement of a convenient lever to any of the different locations shown on the index plate, and it is impossible to engage either the cross or longitudinal feeds when the machine is set for screw cutting.

BRITISH SMELTING & REFINING Co. LTD

DRUMMOND BUILDING MONTREAL and 13 VICTORIA STREET LONDON S.W.1

## You can't help noticing the good qualities of Pratt & Whitney Taps

Their free cutting qualities, their extreme accuracy and their extraordinary ability to outlive others distinguish them.

The con-eccentric relief—a distinctive P & W feature—is the secret of their goodness. One-third of the cutting edge is concentric. The remaining two-thirds has eccentric relief. Taps can be sharpened at the only correct point—on the face of the cutting edge. Sharpening in no way affects their size.

Yes, they cost a little more than some others, but they're well worth the difference. Carried in stock as are all other P & W Small Tools at our sales offices and agencies as listed.

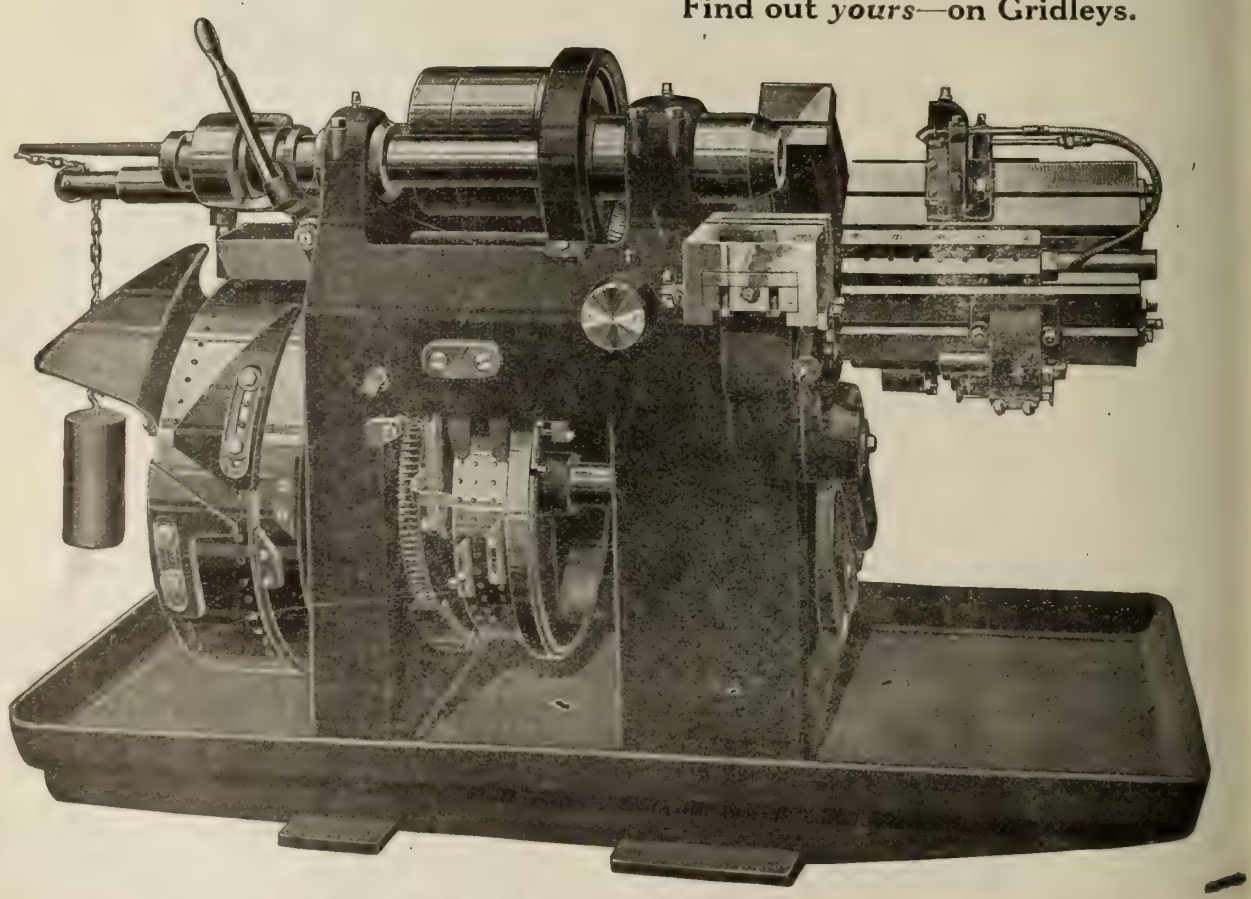
# *Pushing the Heavy Turning on GRIDLEY AUTOMATICS*

**Speed of output and accuracy are sometimes strange bedfellows.**

**With accuracy constantly in the foreground Gridley Automatic Turret Lathes are constructed to be pushed in the long or heavy cut and to stand up under continuous running.**



**After all, turret lathe efficiency is low per piece cost, and low costs mean simply getting the maximum output per hour and accuracy as good as you want it.**

# How to Save Money on Hack Saw Blades

Do you "get prices" when you buy hack saw blades? If you do, you are fooling yourself.

The place to save money on hack saw blades is not on the purchasing agent's desk, but in the shop.

Cost per blade has but little or nothing to do with hack saw economy. The blade that will really save money for you may cost a little more per blade, but a great deal less per cut. Figure cost by service rendered and you will realize why so many purchasing agents have changed their specifications from "Star Blades or equal" to "Star Blades—no substitute."

You can use one Star Saw on more kinds of sawing and use it longer.

You have fewer blades to buy; that means you have less money tied up in stock and less chances to run out of sizes.

Star Saws are standardized for all kinds of cutting. You can keep a medium-sized blade in your machine and use it for all kinds of work except very large or small cuts.

It is all due to the way Star Saws are made. In Star blades, the greater amount of tungsten and the acute cutting angle of the teeth enable you to go through heavy work almost as easily as light work—the hardest steel as well as the softer metal.

Don't let "prices" fool you. It's the work that the Star does out in your shop that saves you money.

## Star Saws are Now Sold By the Makers

We now sell our own product, for we believe no other organization is in such a good position to give selling service on Star Saws as our own factory that has made them for 37 years.

We are not satisfied only to sell you Star Blades, but stand ready to render you every service in getting the best results in their use.

# THE JOHNSON FRICTION CLUTCH

## Put Johnson Clutches on Your Machines

The tight and loose pulley is passing from favor. With all its disadvantages, it long survived because a reliable friction clutch was not in evidence.

But in the Johnson Clutch, builders of high grade machinery have found a real clutch service. It has been thoroughly tested and adopted on the finest machines made.

Replace your tight and loose pulleys with Johnson Clutches.

*Single Clutch with Pulley Mounted*

# Die-Castings Promote Economy

Of course you know of Dumore Grinders—their precision, their long life and their reputation for dependability. Every part of Dumore Grinders except, of course, the spindles, handles, etc., are die-cast.

This is but another example of the extent to which die-castings can be used.

Do you require machine parts in large numbers? If so, you can save considerable expense by having them die-cast.

The making of a quantity of duplicate parts by the die-casting process is both efficient and economical.

Get your die-casting from Fisher — the largest maker of die-castings in Canada. Fisher die-castings are clean and accurate; they require no machining; they come to you all ready to assemble.

# WILLIAMS' "AGRIPPA" TOOL HOLDERS

THE production of superior drop-forged tools is traditional in our works. For nearly half a century our entire energy, equipment and resources have been devoted, wholly and exclusively, to the manufacture of the highest grade of product made possible by the development of the drop-forging art.

Like all of our *standard* Machinists' Tools, Williams' "Agrippa" Tool Holders are built for service—severe service that tries stamina to the utmost. Drop-forged from a special grade of carefully selected steel — scientifically heat-treated and hardened — they are sturdy, dependable tools of proven strength and merit.

A wide range of sizes in standard patterns for all regular machining operations: Turning, Boring, Planing, Threading, Knurling, Cutting-off and Side Work.

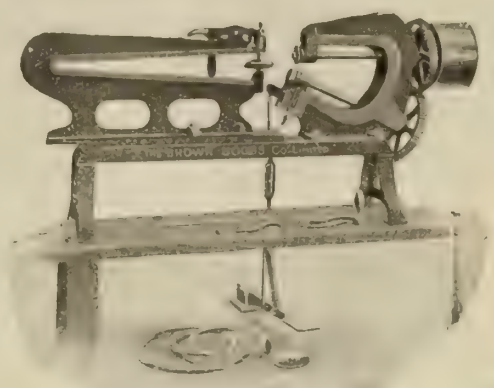
# BROWN-BOGGS

B B

## Some of the reasons why the B-B TRADE-MARK Stands for *Reliable Service*

The designs of the various "B-B" tools are the result of many years' exhaustive experiment and manufacture.

Only the highest quality materials are used in their construction.

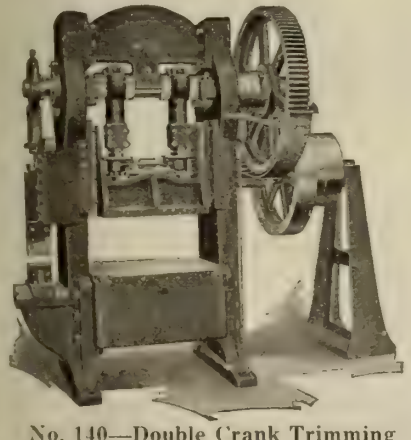


Every workman is thoroughly competent.

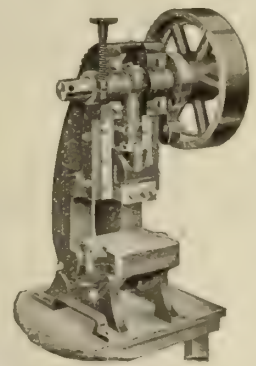
Our plant is modern and fully equipped.

Before every improvement is adopted it must **prove** its worth.

Each tool, before it leaves the factory, is rigidly tested to insure a high safety factor.

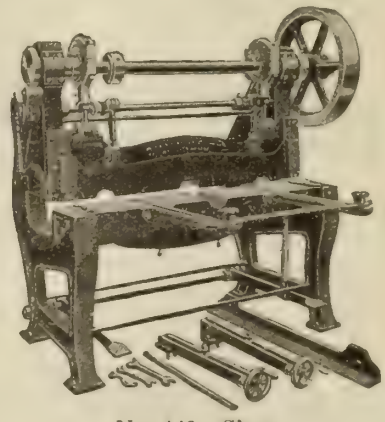


Every "B-B" product is fully guaranteed.



No. 36—Ring and Circular Shear

The "B-B" line comprises tinsmiths' tools and sheet metal working machines of all kinds; canners' and evaporators' machinery, shears of every description, power presses for punching, forming, embossing, blanking.



**We shall be glad to send you a catalog containing a full description of the tools in which you are interested.**

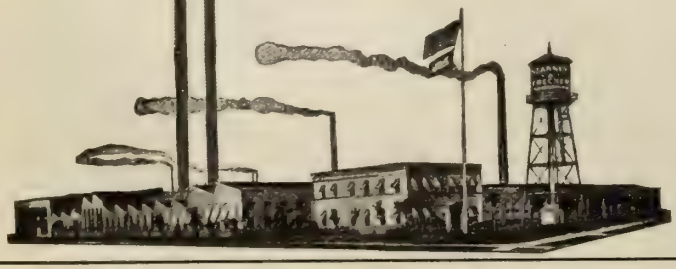
# MILWAUKEE MILLING MACHINES



## *Every Feature An Aid To Milling Economy*

TO MEET the varied demands of different classes of work with speed and accuracy, we have incorporated many notable features in Milwaukee Milling Machines which qualify them to accomplish successfully the most exacting requirements. They are designed and constructed to economically perform all classes of milling—light or heavy.

Milwaukee Horizontal Milling Machines possess the double overarm—solid top, box section knee—automatic flooded lubrication system, one and one half gallons of oil per minute flowing over all gears and bearings in the column, feed box and pulley bracket—cutter lubricant pump which functions only when the spindle revolves—flanged spindle with hardened steel collar for driving arbors—constant speed drive, reverse being self-contained.

All these features contribute to "Milwaukee" efficiency and profitable production. Let us send our catalogue.

# SHEPARD
ELECTRIC CRANES & HOISTS

## Overhead, out of the way —

a "Shepard" tracks along on a Monorail—if necessary, picking a load at one extreme of the plant, carrying and putting it down at the other. One man, the operator in the traveling cage, controls every operation.

A Shepard Monorail system takes up no floor space; it is out of the way, and utilizes space that could not be used otherwise.

A Shepard Electric Hoist is economical to operate, and is easily maintained. Dirt, dust, fumes, and dampness can in no way "touch" electrical and mechanical operative mechanisms which are contained within tight metal housings.

Shepard engineers will gladly talk with you regarding a more economical means of transferring and rehandling for your business. Their services do not obligate you.

"Shepard" makes Electric Hoists ½ to 30 tons; Electric Traveling Cranes 1 to 50 tons; Electric Winches; and Cargo Handling Equipment for Docks and Ships.

THE SIGNIFICANCE TO *YOU* OF THE MEMBERSHIP OF

# CANADIAN MACHINERY

IN THE ASSOCIATED BUSINESS PAPERS, INC.

**YOU depend upon Canadian Machinery for an unbiased and accurate report of all news affecting your business interests.**

**Probably, too, you give heed to its editorial counsel in many matters of considerable consequence. You have a right, therefore, to know about the policies and principles back of the important service rendered by Canadian Machinery.**

**The membership of this publication in The Associated Business Papers, Inc., means that it has achieved an exceptionally high publishing standard, and has subscribed unreservedly to these—**

## STANDARDS OF PRACTICE

**The publisher of a business paper should dedicate his best efforts to the cause of Business and Social Service, and to this end should pledge himself—**

1. To consider, first, the interests of the subscriber.
2. To subscribe to and work for truth and honesty in all departments.
3. To eliminate, in so far as possible, his personal opinions from his news columns, but to be a leader of thought in his editorial columns, and to make his criticisms constructive.
4. To refuse to publish "puffs," free reading notices or paid "write-ups"; to keep his reading columns independent of advertising considerations, and to measure all news by this standard: "Is it real news?"
5. To decline any advertisement which has a tendency to mislead or which does not conform to business integrity.
6. To solicit subscriptions and advertising solely upon the merits of the publication.
7. To supply advertisers with full information regarding character and extent of circulation, including detailed circulation statements, subject to proper and authentic verification.
8. To co-operate with all organizations and individuals engaged in creative advertising work.
9. To avoid unfair competition.
10. To determine what is the highest and largest function of the field which he serves, and then to strive in every legitimate way to promote that function.

If you have read the foregoing standards, there is not much left to be said, except to tell you that these principles are *present day realities* and not merely beautiful ideals for future attainment.

HEALD

# Have You Ever Considered The Cylinder Regrinding Business?

**Heald Style No. 55**

*Simple*
*Moderate Price*
*Large Capacity*
*Wide Range*
*Self-Contained*

Notice how well a Style No. 55 supports a six cylinder casting.

If you have ever contemplated going into the regrinding business you have undoubtedly considered a Heald Machine. Possibly you felt it was a little more than you could carry financially, but listen to this—

Our latest style No. 55 has all the advantages of the old machine for regrinding purposes, but we are able to sell it at a reduced price.

How did we do it?

Not by reducing the Heald quality. No, indeed. That is against the Heald policy, but we have eliminated the feed boxes and expensive units so necessary in a manufacturing machine and substituted a driving unit which furnishes power for the speeds and feeds, also making it self-contained.

Then again we have made it wider, to better support large castings, and also increased the capacity by a greater distance between the tables and the grinding circle.

**There are a number of things we would like to tell you in addition to the price and capacity if you will give us your name and address.**

## The Heald Machine Co.

**51 New Bond St.**

"Good workmen know the difference"

# *Not bolted to the floor—why?*

*(Ask Gordon Scott, He Knows)*

This was in August, 1919.

Gordon Scott, Manager of the Peerless Surfacing Machine Company of Troy, New York (manufacturers of Peerless Surfacing Machines), laid down the report of the tests. "It's as if we had built a fine safety razor but couldn't get good blades for it," he said.

These tests showed that Peerless Surfacing Machines were O. K., true-running, production boosters —that the defective work complained of was due to the abrasive belts used.

"Ordinary belts won't do," ran the report. "Their belt joints are thicker than the rest of the belt and give a marked 'hop' or 'jump' on each revolution. This causes marred, scratched work."

And a little further down Scott read, "One belt stands out—Speed-grits Uniflow belt. Recently developed by Manning Abrasive Company. Has an absolutely flat joint. No 'jump' or 'hop' no matter how many R. P. M. Gives perfect finish."

Now notice the picture above. A Peerless Surfacing Machine running at top speed while simply set on the floor (*not* bolted). Its "jumpless" Speed-grits Uniflow belt is grinding a block of carbon steel.

On steel, alloy, iron, wood, or hard rubber—smooth-running Speed-grits Uniflow belts give speed in production *plus* perfect finish.

Today you can order Speed-grits Uniflow belts by mail—one or a dozen. Just send a piece of a wornout belt of the type now being used.

(Many abrasive-belt users tell us that taking the "jump" out of the belt joint is the biggest thing accomplished in the abrasive industry since the discovery of artificial abrasives.)

Why not find out? Order your trial Uniflow belts today.

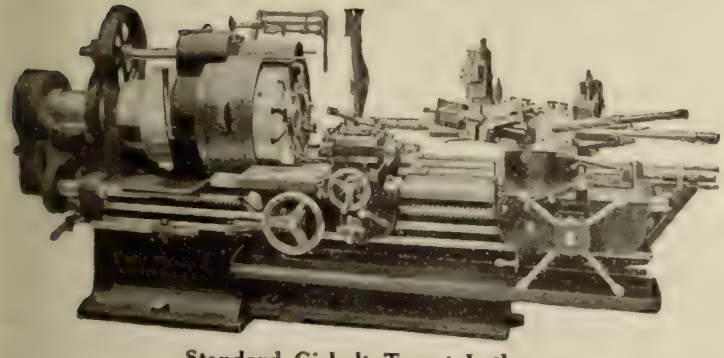
## Compare This Production With What You Are Getting



### 12 MINUTES

This cast iron piece was finished all over in 12 minutes with a Standard Gisholt Turret Lathe with Standard Tools only.

Consider your time on similar work.

Are you content to keep on doing it your way or will you put it on the Gisholt Standard Turret Lathe?

**Standard Gisholt Turret Lathe Equipped with Standard Chucking Tools**

This piece is but one of hundreds of jobs that can be done on Gisholt Lathes, each with its own worth-while saving in time.

The way is open to you to secure greater economy. Why not let a Gisholt Salesman call and explain more fully.

# FAIRBANKS-MORSE

## A National Institution of Mechanical Service

IN Canada, as in every country in the world, there are names which, through years of service, have warranted national confidence and good-will. In the Canadian world of mechanical and engineering efficiency there is one name which enjoys the distinction of leadership. Its prestige carries through the entire coast-to-coast chain of sales offices and warehouses into every city, town, and hamlet.

Fairbanks-Morse products mark the farmer, the manufacturer, the artisan, and all users as careful and practical buyers of mechanical goods. The Fairbanks-Morse 100% quality seal is the buying guide for the consumer—the guarantee of satisfaction.

The Canadian Fairbanks-Morse general catalogue is a reference of what is standard in design and practice in mechanical goods. This book lists the largest variety of scales, valves, steam goods, oil engines, pumps, electrical machinery, machine tools, woodworking machinery, transmission appliances, railway contractor's and machine shop supplies ever published in Canada in one book. Your copy will be sent on request.

# *Tooling the Modern Turret Lathe*

## Proper Methods of Chucking—Holding Work by Special Jaws—Angle Plate Fixture—Cradle Fixture, and Varied Indexing Fixtures.

*By A. H. Lloyd, B.Sc., M.B.E.*

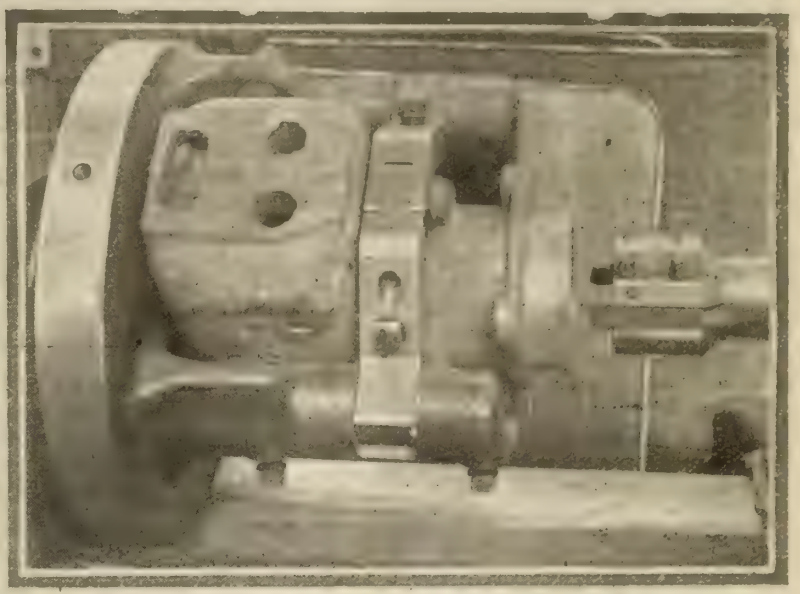

FIG. 7.—CRADLE FIXTURE FOR HOLDING CYLINDER CASTINGS.

MUCH of the prejudice which existed against capstan lathes and turret lathes in their early days was probably due to a fear that when the lathes were installed the results would fall short of expectations, due to lack of proper tool equipment. To be dependent on the machine tool maker for special tools for each and every job which came along was not altogether a desirable position, yet many firms hesitated to take the obvious course of starting tool designing and tool making departments of their own. The war swept away all this prejudice by force of circumstances. Enormous numbers of turret lathes came into being, and many users were compelled to tool up the machines themselves owing to the inability of the makers to meet the demand for special tools. This was a good thing, for in doing so they gained confidence in their ability to get the best out of costly and valuable machines, with the result that turret lathe tool design is now accepted as a scientific subject of great importance and is given considerable attention in the technical press.

Realizing some of the difficulties of turret lathe users when production was of such importance, the firm with which I am connected published in 1916 a book called "How to Lay-out Turret Lathe Tools," in which an attempt was made to enunciate certain broad principles of

turret lathe tool design and practice which, if adhered to, would enable anyone with a fair shop experience to undertake this work with a reasonable assurance of success. In this article I propose to approach the subject by giving a number of examples of modern turret lathe lay-outs, from the description of which we shall, I hope, be able to extract some information of interest and value. In doing so I shall exclude consideration of hexagon turret lathes for producing articles from the bar, as this type of lathe is always equipped with a very complete outfit of tools which enables it to handle all ordinary work within its capacity without the use of special tools.

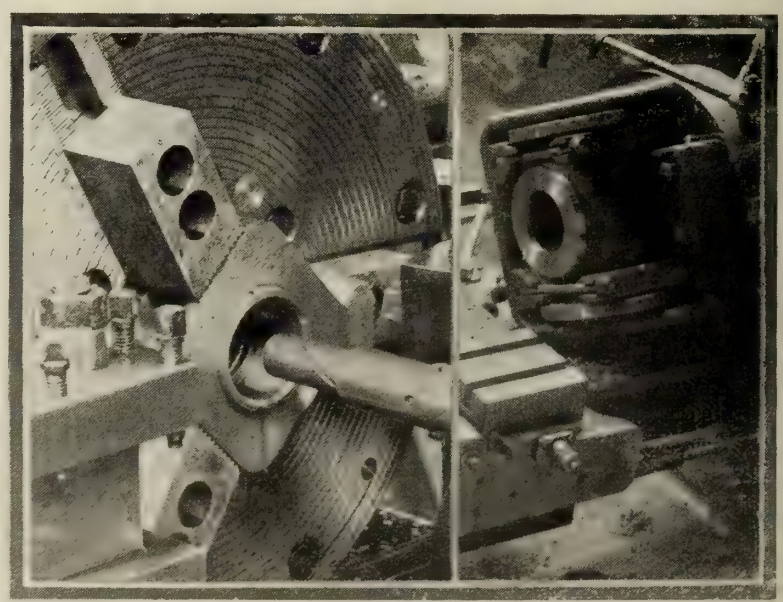
### Two Viewpoints

Every turret lathe job has to be considered from two points of view, namely, chucking and tooling. The chucking often gets insufficient consideration, and one sees an otherwise good lay-out of tools spoiled by inefficient chucking. First let us consider some examples of chucking in the "Coventry" concentric chuck, which possesses great gripping power, and adaptability to irregular objects by the use of special jaws.

At Fig. 1 is shown a set of special jaws for holding a drop forging, which is the front plate of a roller steady box-tool. The machining operations consist of drilling, boring, facing, and the interest lies entirely in the method of chucking. One jaw grips the boss whilst the second, which is of vee block form, engages the corner and positions this correctly, whilst the third jaw grips behind the boss on the top side of the stamping. This piece would have been a very awkward one to handle in the ordinary way, but with the special jaws correctly fixed in position, chucking is as simple as in the case of an ordinary circular object. In order to facilitate putting special jaws in the correct position on the jaw slides, it is good practice, after they have been once set up and adjusted to a sample stamping, to mark lines on the sides of the jaws, which register the position in relation to one of the rings on the face of the chuck.

In dealing with pieces of work like stuffing boxes, glands, and similar articles, one is often faced with the necessity of requiring the chuck jaws to grip on an oval flange. This has usually been looked upon as legitimate work for a two-jaw concentric chuck or a four-jaw independent chuck. Those who have had experience of two-jaw chucks, however, know that they are usually short of gripping power, which of course makes it difficult to get the best out of the tooling. On the other hand, four-jaw chucks, whilst having plenty of gripping power, are, to my mind, not so quick and sure to operate as the concentric chuck. By designing special jaws, oval flanges can be held in the manner shown in the next slide. One jaw grips across the minor axis of the oval, whilst the two remaining jaws are bevelled off symmetrically and form a centralizing vee.

In equipping Herbert combination turret lathes and capstan lathes we manufacture large numbers of boring bar holders, which are made from iron castings. These are bored and faced on auto lathes, and at one time the castings were chucked in cradle fixtures. Subsequently the question of gripping them in the concentric chuck was considered, with the result that the set of jaws shown at Fig. 3 was designed.



Two of the jaws are made from standard bar jaws tapered to suit the casting, the third jaw is made from a standard soft jaw blank, in which a traverse vee is machined for locating and gripping on the pad bolt boss. It is not difficult to imagine that this method is much quicker that the fixture method of holding, and in addition has the advantage that it ensures concentricity of the hole with the outside of the casting, since the arrangement is self-centering despite slight variations in the castings.

### The One Jaw Method

A special method of chucking which is often very helpful to tool designers is known as the "one-jaw" method, an

*This article, which is the first of a series, is written by an authority on this class of work As he so aptly remarks in the present portion "The chucking often gets insufficient consideration, and one sees an otherwise good layout of tools spoiled."*

*The various fixtures shown can equally be applied to other similar shaped parts, so that readers would do well to more than lightly consider the examples depicted. We believe this series will be filed away by many readers for future reference, and each will be complete in itself. The next portion will appear March 24th, and will go into tool layouts of various kinds.*

LEFT HAND VIEW, FIG. 5, SHOWING SPECIAL JAWS FOR HOLDING SQUARE PIPE FLANGE
RIGHT HAND VIEW, FIG. 8, SHOWING SPECIAL FIXTURE FOR HOLDING GLOBE VALVES

example of which is shown at Fig. 4. The work is an aluminum die casting, the end shield of a motor-cycle magneto. This piece cannot be satisfactorily gripped with three jaws on the boss, as it is of a peculiar shape, and moreover, gripping at such a point would be liable to distort the finished hole. In the method of chucking shown, the gripping is done by a single jaw against an adjustable locating block bolted to the face of the chuck, the two other jaws being removed. The locating block is made in two parts, the upper portion being adjustable inwards by two set screws which facilitate setting up true. When adjusted to the casting the locating block is clamped up by means of two collar screws.

Holding square objects in the "Coventry" chuck is as easy as holding oval flanges, as will be seen at Fig 5. The article in the chuck is a steel pipe flange which has to be bored, faced and tapped. One standard jaw grips on a corner, whilst the two remaining jaws are bevelled off to a suitable angle. In this case the jaws are gripping on an unmachined surface, but the same method is applicable to finished work.

Fig. 6 illustrates how we use it in our own practice for boring and facing the square turrets of our lathes. In producing these parts the steel bars are milled in lengths, afterwards being cut up and milled on the remaining sides, the lathe operation being the last. It is therefore very important that the lathe work should be concentric with the previous machining, and the method of chucking adopted gives the required degree of accuracy.

### The Use of Fixtures

The preceding examples may be regarded as typical of work which can be held in a concentric chuck, and we may now consider the question of fixtures. You will appreciate that this is a subject of which we can only touch the fringe, and we will merely consider what are the desirable features to be aimed at in fixture design. They should, of course, be designed with as little overhang as possible, so as to make the work rigid under heavy cuts; they should be accurately balanced to avoid vibration at high speeds; they should be as light as is consistent with ample strength; the means of clamping should be rapid and secure.

Broadly, fixtures can be divided into two types, namely, those in which the work is located from an unmachined surface, and those in which it is located from a surface machined at a previous operation. An instance of work located from an unmachined surface is shown at Fig. 7. The fixture shown was designed for holding water-cooled cylinders of a "Lister" engine during the boring operation, which is done on one of our No. 9 combination turret lathes. At first sight it might appear that this piece could be held in a concentric chuck by designing special jaws, but in this particular instance the fixture is better practice.

FIG. 10.—INDEXING FIXTURE FOR AERO-ENGINE CRANKCASES

Gripping with jaws would, in all probability, crack the water jacket, and, in addition, the work would overhang so far from the chuck that it would not be possible to turn the skirt at the same time as boring. The casting is located in the fixture on four adjustable set screws which form a vee, and is clamped against this by two more set screws carried in a strap bridging across the fixture. The strap is made in two parts which are hinged about pins in the sides of the fixture. The hinges are jointed together in the centre where they overlap, by a hardened pin which is a push fit through the two parts of the strap. When removing the casting from the fixture, the two clamping screws are slacked off and the central pin withdrawn, thus allowing the two portions of the strap to be swung clear of the work. This method of clamping is rapid, as the strap, being made in two hinged parts, is easier to manipulate than the conventional single piece strap.

Fig. 8 depicts a special fixture for holding globe valves on a No. 9 combination turret lathe during the machining operation on the centre hole and flange. The casting is drawn down on to two vee blocks shaped to suit the shoulders of the valve casting by means of straps clamped by swivel bolts. One nut only is required to clamp each strap, as the bolts at the rear are hinged to the straps. When chucking or unchucking, the straps are swung clear of the work and retained in position by two plungers carried in the balance weight. The locating blocks and clamps are removable, so that the same fixture can be made to accommodate various sizes of valve.

At Fig. 9 is shown an angle plate fixture for holding a carburetor body. In this case the location is obtained from the float chamber which has been

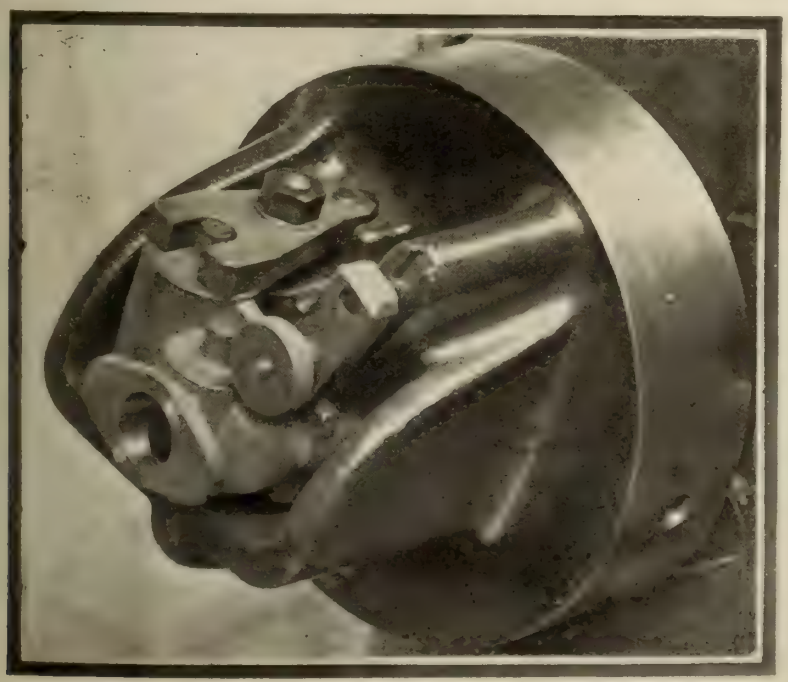


FIG. 9.—ANGLE PLATE FIXTURE FOR CARBURETOR BODIES.

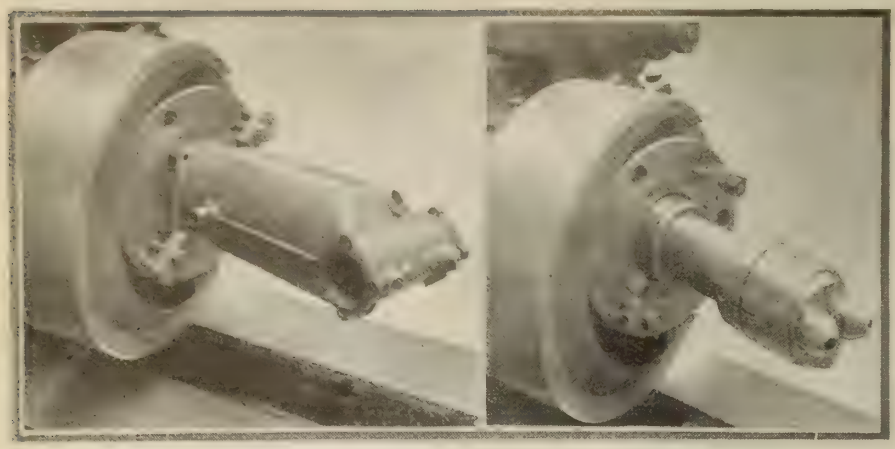

FIG. 11A—LEFT HAND VIEW. SKEWED INDEXING FIXTURE FOR AERO-ENGINE CYLINDERS
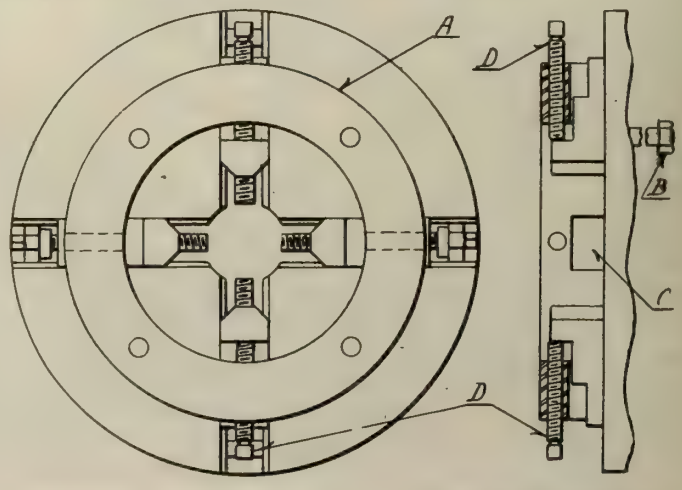
FIG. 11B.—RIGHT HAND VIEW SHOWING THE CYLINDER REMOVED.

machined at a previous operation. The casting is clamped down on to a short spigot, locating in the float chamber bore, the clamp having a slot in it, so that when the nut is released sufficiently to allow the casting to be raised from the spigot, it can be taken straight out. The other clamp is operated by a knurled nut, and serves to swing the casting around to an adjustable locating point at the rear. A partial turn of the nut is sufficient to allow the clamp to be slid out of the way and allow the casting to be removed from the fixture.

### Indexing Fixtures

We cannot leave the question of fixtures without discussing indexing fixtures. A very good example is depicted at Fig. 10. This shows an operation on the crankcase of the "Le Rhone" rotary engines. In this engine the cylinders are radially disposed round the crankcase, and are secured in position by screwing them down into their seating. The operations consist of boring, bossing, facing and screwing, and in connection with the latter operation it is necessary for the thread to start from the same point on all holes, so that the cylinders screw down into alignment with the valve tappet mechanism. The work was done on a No. 9 combination turret lathe, and the indexing fixture was designed by Messrs. W. H. Allen of Bedford. In the fixture is a central pillar bored out and fitted with a steady bush which serves to pilot the boring bars used at this operation. The screwing is done with a Coventry collapsing tap which is started by connecting it to the chasing saddle. This fixture provided a boldly conceived method of doing an unusual job in a rapid manner.

The peculiar indexing fixture shown at Fig. 11 was designed to hold the cylinders of the Rolls-Royce "Eagle" engine whilst boring the valve holes in the head. The work is located by an expanding peg and is also clamped down on a faceplate. In the flange of the cylinder there are two accurately spaced dowel holes of unequal diameter which locate the cylinder on the crankcase. The smaller of these two holes is utilized to locate the cylinder in the first position on the fixture by means of a dowel on the faceplate. When the first hole has been bored, the clamps are swivelled out of position (as shown in the view of the fixture with the cylinder removed), the expanding peg is released, and the cylinder rotated by hand through approximately 180 deg. The actual location for the second hole is done by pushing a hardened plug through the finished valve hole, thus lining it up with a locating hole at the front of the fixture. When in the second position, the dowel is in the large hole, so that it does not influence the location.



### HEAT TREATMENT OF STEEL

According to Scientific Paper No. 395 of the U.S. Bureau of Standards, the experimental results obtained by the Bureau regarding the relation of high temperature treatment of high-speed steel to secondary hardening and red hardness appear to warrant the following conclusions: (1) Secondary hardening necessitates prior partial austenitization produced by the high-temperature treatment; (2) the variations with heat treatment in physical properties and microstructure of high-speed steel are analogous to those of hypereutectoid carbon steel with the exception of the microstructure of hardened but untempered steel; (3) red hardness is largely a function of the composition of the matrix, and is only comparatively slightly affected by the amount of dissolved carbide. Three reasons are given for the established advantages derived from the use of the high-temperature heat treatment—namely, increased red hardness, increased initial hardness, and reduced brittleness.

# *Increasing Grip on the Work*

Chuck jaws after long service become worn owing to the frequent gripping of work on the extreme end. When working on heavy jobs the grip seldom takes place along the entire jaw, the result being loss of rigidity and tool troubles. To remedy this on a particular job some time ago we had recourse to the idea here shown.

A ring A of suitable size was faced on one side and slotted at four points for jaw clearance C, and secured to the chuck face by four bolts B. Immediately over each jaw a screw D was located so that the "slack" could be taken up and the necessary pressure applied to give a parallel and firm grip.

*Canadian Machinery*

# One Method of Producing Steel Barrels

## Importance of Steel Used in Manufacture—Press Operators—Two Styles of Reinforcement, Rolled on Body, and Separate Hoop—The Detection of Leaks—System of Galvanizing.

By J. H. MOORE

THE relatively short life of wooden barrels, together with the steadily increasing cost of wood suitable for barrel making, has, within the last few years, greatly increased the popularity of the steel barrel. Experience has proven that steel barrels are unusually well suited for many classes of service, and although various concerns may turn out a similar product in an entirely different manner, the sequence of operations are of rather standard style. We make this explanation so that it may be quite clear that we are not telling "How to make steel barrels," so much as we are narrating the method employed by the W. D. Beath, Ltd., Toronto, Canada. This concern has been producing steel barrels of different sizes for some considerable period, and have embodied the very best practice obtainable through such experience.

### The Steel Used

Hot rolled steel is, as a general rule, used for making steel barrels, and three pieces of steel are required to complete a barrel. When we say three pieces, we do not infer that there are only three pieces to a barrel, but what we mean is this, that there are three main pieces, namely, the body, and the two heads, sometimes called the top and bottom. As a rule the body material is made from 13-gauge stock, and the heads from 12-gauge material.

The raw material arrives at the plant in sheets of such size that those used for body making only require a slight amount of trimming under a squaring shear. The sheets from which the heads are drawn are usually made in a size that allows the blanking and drawing of three heads. This style of sheet is easy to handle, and economical. The chemical composition of barrel steel is perhaps the most important factor in successful barrel making. Poor steel means endless trouble, in the shape of faulty seams, cracks and so on. For this reason the concern we speak of are very particular regarding the stock they use.

### Making a Barrel

Let us suppose we are going to watch the making of a barrel, right from the raw stock to the finished product, the barrel being of the galvanized variety. We shall commence with the body, digressing when necessary to the making of the heads.

THIS VIEW SHOWS A TYPICAL EXAMPLE OF BARREL, TOGETHER WITH A SEPARATE TOP AND BOTTOM

The raw material for the body comes from the stock room in sheets, as already described, that require only a slight trimming on the squaring shear. After squaring they go through what is termed the first rolls, and there they are rolled, after which they are seamed by a welding torch as shown in the photograph. A complete line of these torches and welding stands are installed and the line presents a very busy appearance indeed. After the seams are welded, the partially completed barrel takes various steps, depending on its nature.

For example, two types of barrels are made, the reinforced type of barrel, with a steel hoop placed near the top and bottom, and the type which has merely a reinforcement rolled in the body stock itself. The former type is, of course, the stronger, but for some purposes the latter is just as good, and is less expensive.

Should the barrel be of the reinforced steel hoop type, here is what happens. The rolling hoops, as they are called, which are made from flat stock, are rolled, then welded. They are next placed over the body of barrel in correct position, and go into an expanding machine which presses out the stock, gripping the reinforced hoop securely. Later, a band header raises a bead on the body, partially around the reinforced hoop, this making everything secure. On barrels that have no reinforced rolling hoops, the form of reinforcement is rolled on the body itself by means of a siutably formed pair of rolls.

Leaving the bodies for a short time, let us discover how the heads are made. As stated before, three heads are cut from one sheet, and these are cut out on a circular cutting machine. They are next embossed and lettered on a huge Toledo press, and a word of detail regarding this set of dies would not be amiss.

It is no doubt already well known that in turning out barrels such as this, it is necessary that every barrel have a number. The name of the firm for whom

LEFT HAND VIEW SHOWS A PORTION OF GALVANIZING ROOM. RIGHT HAND VIEW DEPICTS THE MAKING OF A BARREL HEAD ON THE PRESS.

the barrels are being made is also usually embossed on the head, and it is for this purpose that the die about to be explained is made.

The idea for the design of these marking dies was really obtained from the way in which a typesetter assembles type for printing. These dies have, however, an advantage over ordinary type insomuch that they can be used over and over again in various combinations and produce any desired marking on the work. It will be apparent from the photograph shown just what style of marking is accomplished. The dies consist of steel blocks, each of which carries a number or letter of the desired size. These die sections are made in pairs, one letter, or figure, being in relief, while the other is cut into the face of the die block. One stroke of the press, of course, completes the impression on the head, which appears in relief.

The heads are next placed on another similar Toledo press, and a flange of about 1½-inch depth all around is drawn, this being for the bottom only. The top heads are of slightly different construction, and have a raised portion on the same, also two holes are punched on this piece. The photograph accompanying the text illustrates clearly the construction of both heads. The nipples are now welded to the top heads on special stands.

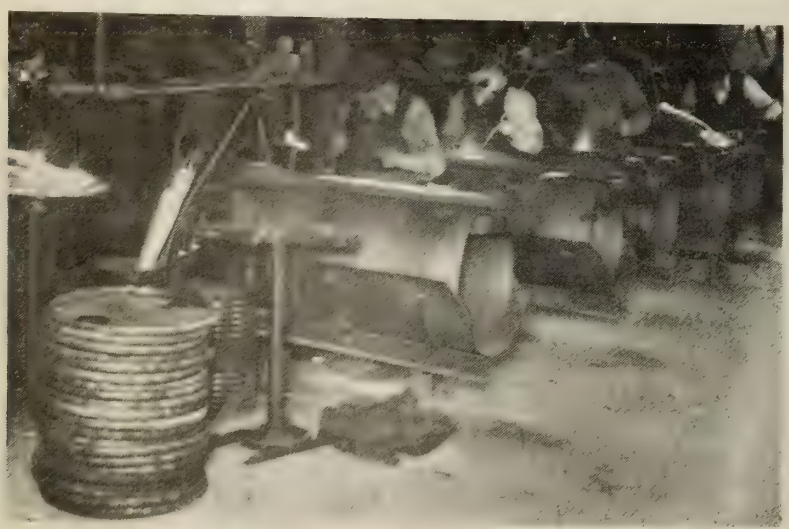
### Assembling Barrels

The heads are next inserted into the body, a special reinforcing ring is placed at the same portion, after which they are rolled into place on a vertical seam rolling machine. Following this seam rolling operation, the edges around both the top and bottom are welded. This operation is also shown by photograph.

This practically completes the barrel with exception of testing, and this operation is performed in the following manner: Every barrel is tested to 15 or 20 pounds pressure, and compressed air is used. To detect leaks, if any, soapy water is used, and, of course, should

BUSY AT WORK WELDING THE SEAM AT TOP OF A BARREL.

there be a leak it soon bubbles up. Having been tested, and taking it for granted that the barrel has to be galvanized, it is passed on to a cleaning machine, which takes out all dirt from inside of barrel. From here it passes into the galvanizing room, and enters the pickling baths, where it stays from 20 minutes to half an hour at approximately 150 degrees temperature. It next goes to a drying oven and is dried.



The barrel is now ready for galvanizing, and briefly speaking here is how this concern dip their barrels. They have an ingenious carriage idea arranged over their tank, and we have illustrated this by photograph. Placing the barrel on the carriage shown, the operator pushes the same up the incline, over the tank on to hook shown, then dips.

The tank containing the galvanizing solution has a coke fire all around it, and it is very important that the galvanizing metal be kept at the proper temperature. After galvanizing, the barrels are unloaded from the tank by reverse of process already explained. To take any pieces of scale, or hardened spelter, from the inside of barrels, a suction arrangement is used, very similar to an ordinary suction sweeper. This removes all dust or scale in very short order.

### Other Operations

Should the barrels be of the painted type, no galvanizing is necessary, and they are dipped in a tank of asphaltum paint, then dried. This concern use a Davis 300-pound capacity acetylene generator, which produces 300 feet of gas hourly. The method of linking up their oxygen cylinders is also worthy of note. The cylinders are linked up in series of 10, and two groups are arranged. All the welding torches are fed from these groups, and as soon as the one group is exhausted the other series is switched over and a new line of cylinders installed to replace the empty ones. In this way there is no delay at any time.

For other classes of work they have a Lincoln electric welder, and the writer viewed a fine example of electrically welded galvanizing tank made by this concern themselves. A notable feature in the making of these barrels is the fact that once the stock is on the move it goes right through with no back motions. By this we mean that the operations are so arranged as to keep the work moving towards the final operation, without any return routine. The heads of barrels go down one side of the plant for a certain distance, while the bodies go down the other side for a like distance. At a certain point they meet and from there the barrel follows the operations already spoken of. Some 500 barrels are completed every nine-hour day.

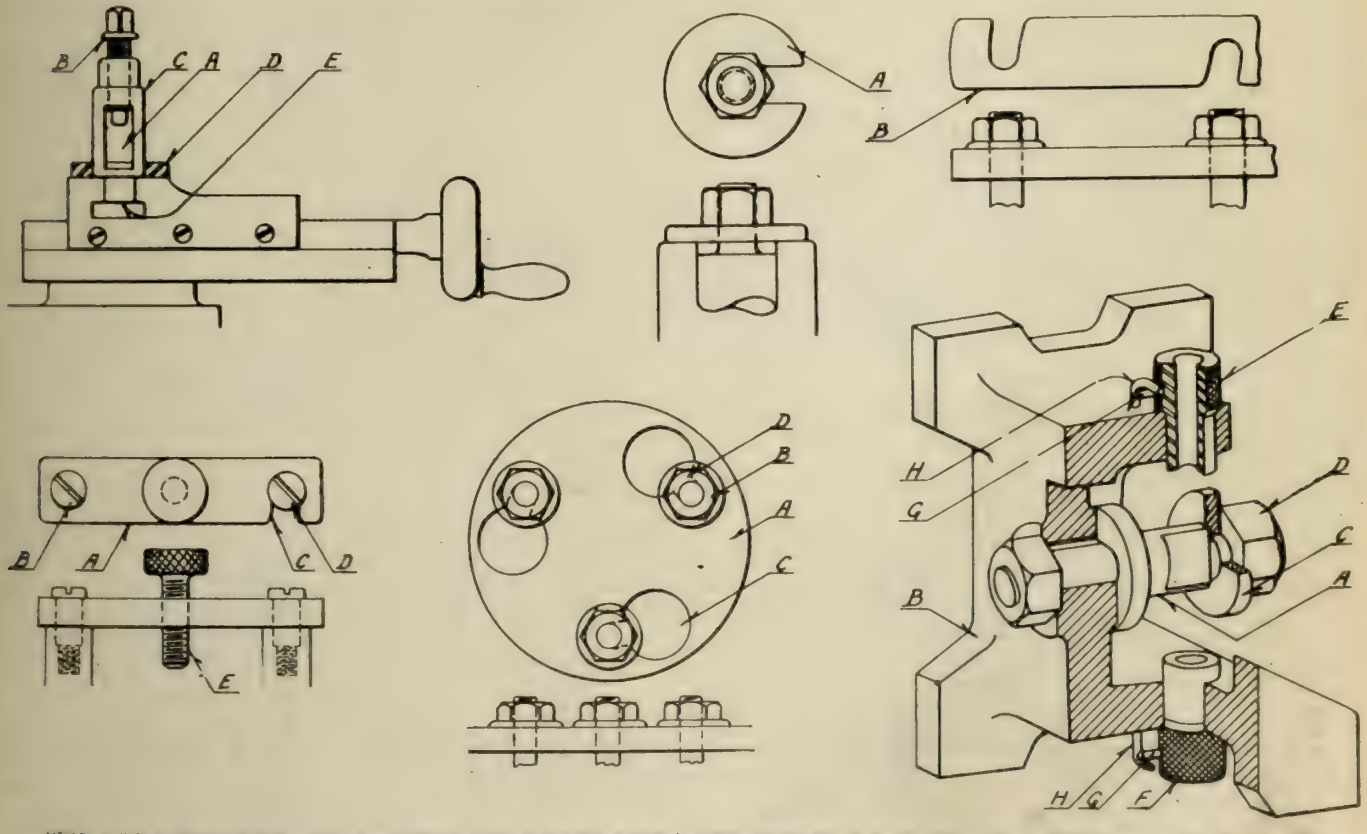
A PARTIAL VIEW OF THE BODY SEAM WELDING DEPARTMENT.

## CHIMNEY TEMPERATURES

An instrument has been produced for ascertaining the temperature of a chimney at various depths. The apparatus consists of three tubes extending to various depths, and enclosed in a long, pointed steel case. These tubes end in bulbs, and are filled with alcohol. At the upper end of the instrument are three dial temperature indicators, each connected to a tube. The scales on the dials range from 32 deg. to about 200 deg. Fah., and are colored black up to 120 deg., but upwards from that temperature the color is red, indicating excessive heats. If several of these devices are forced into a coal pile at varying depths and in different localities, accurate information can be gathered for the whole of the pile. It is stated that instruments employed at intervals of 50 ft. have proved very effective.

# Various Clamping Units of the Slip-on Type

*By F. Scriber*



IN DESIGNING nearly all classes of jig work it is considered advantageous to have the clamping parts arranged for quick removal of the work. Methods of accomplishing this vary considerably and it is the object of this article to describe a number of different types of slotted collars and slotted clamps. Referring to Fig. 1, the illustration at the left shows a clamp which has the hole cut out so as to form a slot. In making this collar it is the usual practice to have the nut which clamps the collar of such a diameter that the work will pass over the nut without removing the same, therefore it is necessary to loosen the nut slightly, when the clamp can be removed by turning the same about its axis, so that work placed under it may be readily removed. This arrangement is often made with both slots cut from the one side.

Fig. 2 shows a round plate A clamped by three nuts B; holes C, suitable to clear these nuts, are drilled in this plate with slots connecting the main bolt holes. Turning this plate about its axis so the holes will line up with the nuts permits removal of the plate, while turning it so that the nuts are over the slots, as illustrated, places the plate in the clamping position. Circular plates of this type are often made with quite a number of holes and bolts, while they are also made in rectangular and other shapes.

A modification of the design shown in Fig. 1 is illustrated in Fig. 3; this consists of a hinged clamp A, which pivots about a screw B, and when in a clamping position the slot C passes over the head of the screw D. The work placed between these screws is then clamped by the knurled screw E. Various modifications of this design will readily suggest themselves in tool design work.

Fig. 4 is an example of the slip collar principle shown in Fig. 1, as used in a drill jig. In using this tool, work which has a hole in it is slipped over the stud A, this stud being clamped into the jig B, the stud being keyed in place to prevent it from turning. When the work is located on the stud the slip collar C is put in place in the manner described in Fig. 1, and the nut D tightened to securely hold the work in place. Two slip bushings, E and F, guide the drills used for drilling the work and these slip bushings are prevented from turning by pins G and hooked pins H.

Collar design that is in general use on lathes is shown in Fig. 5. This design can frequently be used to advantage for holding work in jigs, and it is with this object in view that it is here shown. In using this arrangement the object is to place a cutting tool in the opening A, when by tightening the screw B, the post C is pulled up causing the tool to be wedged against the collar D, the other surface which takes the clamping strain being the upper side of the tee-slot E, and as previously mentioned, this adaptation in varied forms can often be employed to solve tool, jig and fixture problems, one modification of this being to have the post itself carried on a hinged pin so it will align itself when clamped.

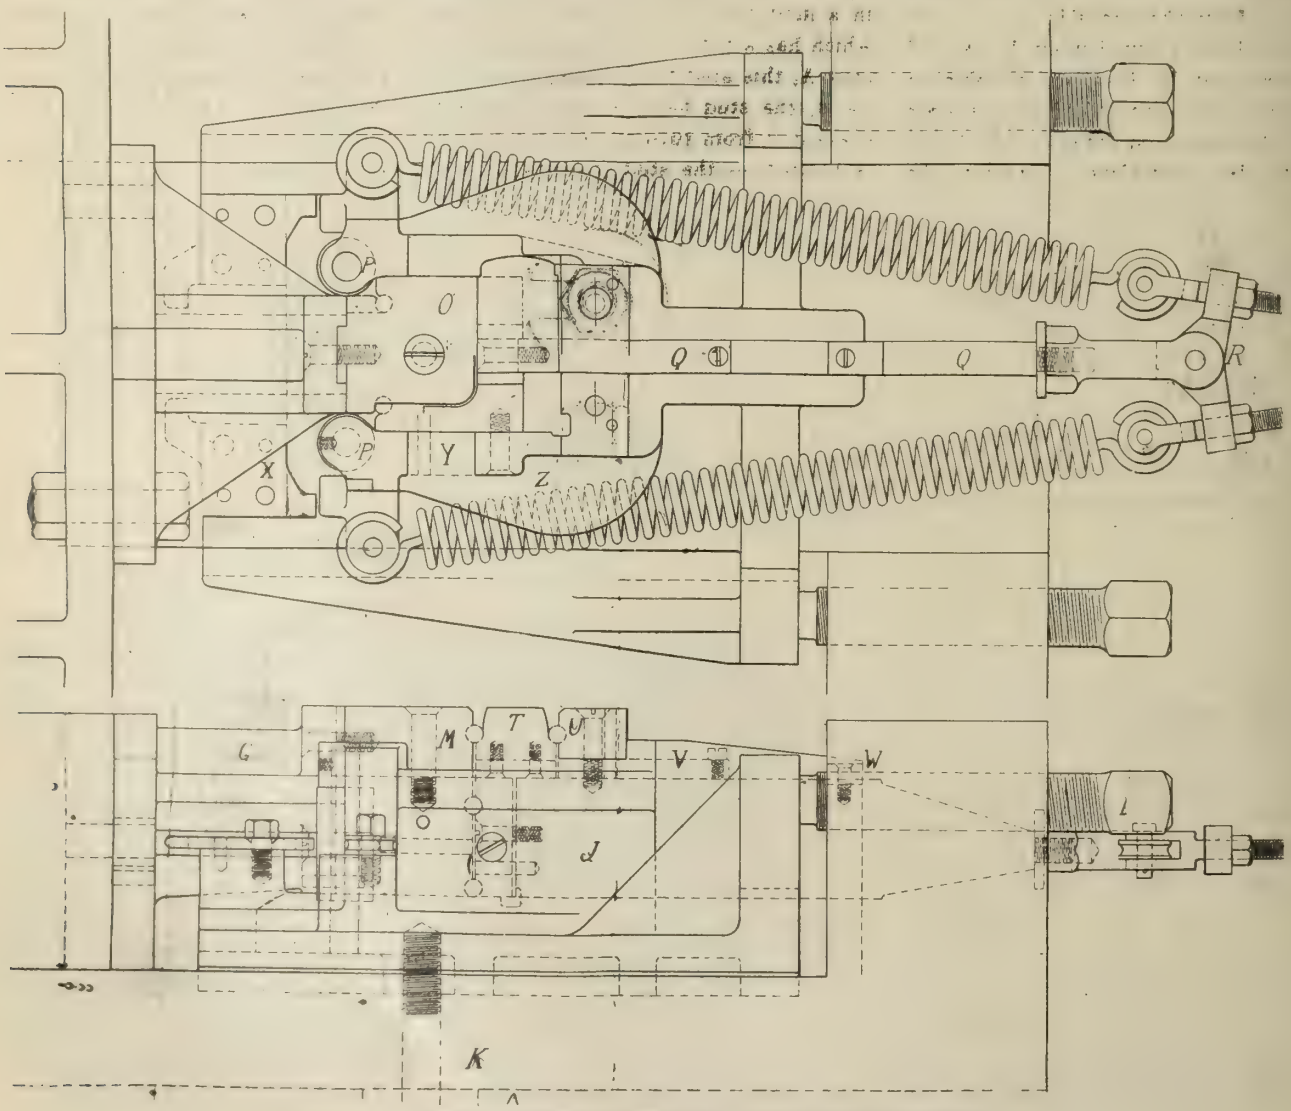
# Making a Bent Ring Cleat on the Bulldozer

## Coiling the Stock—Cutting the Coils Into Rings—Inside Diameter Important, Otherwise Subsequent Die Operations Will be Poor—Light Drop Hammer Used, also Bulldozer.



By G. LAIDLER

THE accompanying article and illustrations describe an interesting method of making bent ring cleats. The piece to be made is a welded ring of 7/16 inch diameter soft steel, the final shape and dimensions being those shown in Fig. 1. The straight rods are received in commercial lengths and the first operation is the winding of the rods around a suitable arbor in the form of a spring, which are afterwards cut into rings with the ends overlapping. The coiling of the rod, shown in Fig. 2, is accomplished in a simple winding machine, which consists of a belt-driven head and a cylindrical mandrel, the diameter being slightly less than that desired for the inside of the rings. The end of the rod is driven by a pin in the flange of the head, and the stock is drawn over a grooved roller as the machine revolves. The work produced is in the form of a helical spring.

Cutting the coils into rings is performed as shown in Fig. 3, a press being utilized for this purpose. The top shear has its cutting edge inclined at a slight angle to the plane of the coil. The body of the spring is held in the hand of the operator with its axis horizontal, against the face of the block A, fixed to the bottom bolster of the press. This cutting block is shaped to support the coil on the inner circumference, and to suit the free face due to the pitch of the helix. The sheared end of the coil is held against a vertical shoulder on the block, while the descending upper shear blade severs the coil at a point a few degrees beyond the complete circle and at a bevel, thus forming the overlap that afterwards is used to make the weld.

It is essential that the inside diameter of the coils be produced to accurate dimensions to insure successful work in the subsequent die operations. Each coil, therefore, is gauged after cutting, by placing on a circular block which is shaped to the inclination of the overlapping end. The operator discards all rings not conforming to the limited tolerance.

The rings are then heated in a furnace conveniently located to a light rope drop hammer fitted with suitable welding dies. The dies are made to envelop about two-thirds of the circle, the remaining third providing a hold for the operator's tongs. The lower die has a tapered central portion D, which stands

A DETAIL VIEW OF THE FINAL BENDING OPERATIONS.

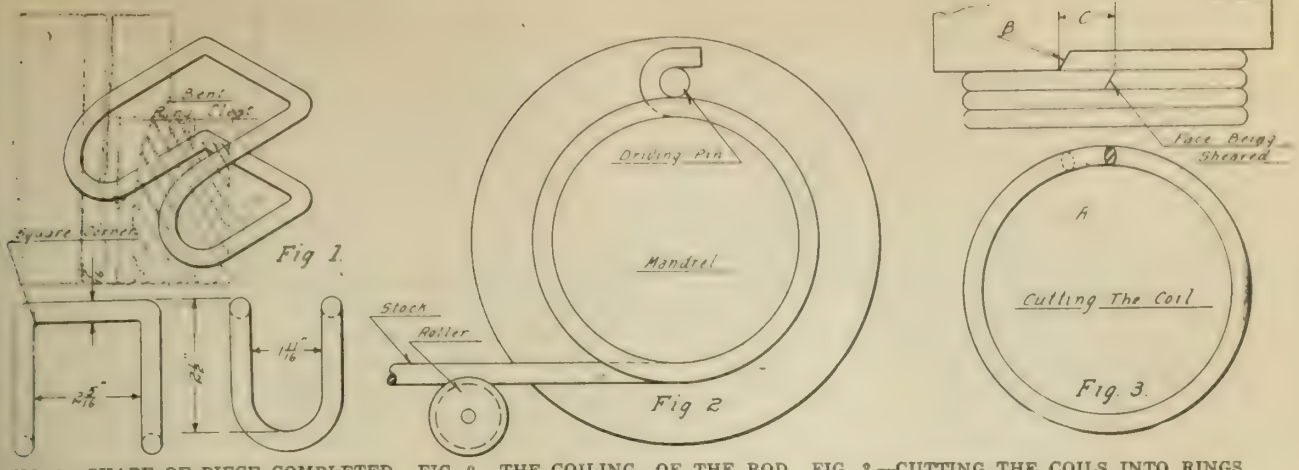


FIG. 1.—SHAPE OF PIECE COMPLETED. FIG. 2.—THE COILING OF THE ROD. FIG. 3.—CUTTING THE COILS INTO RINGS.

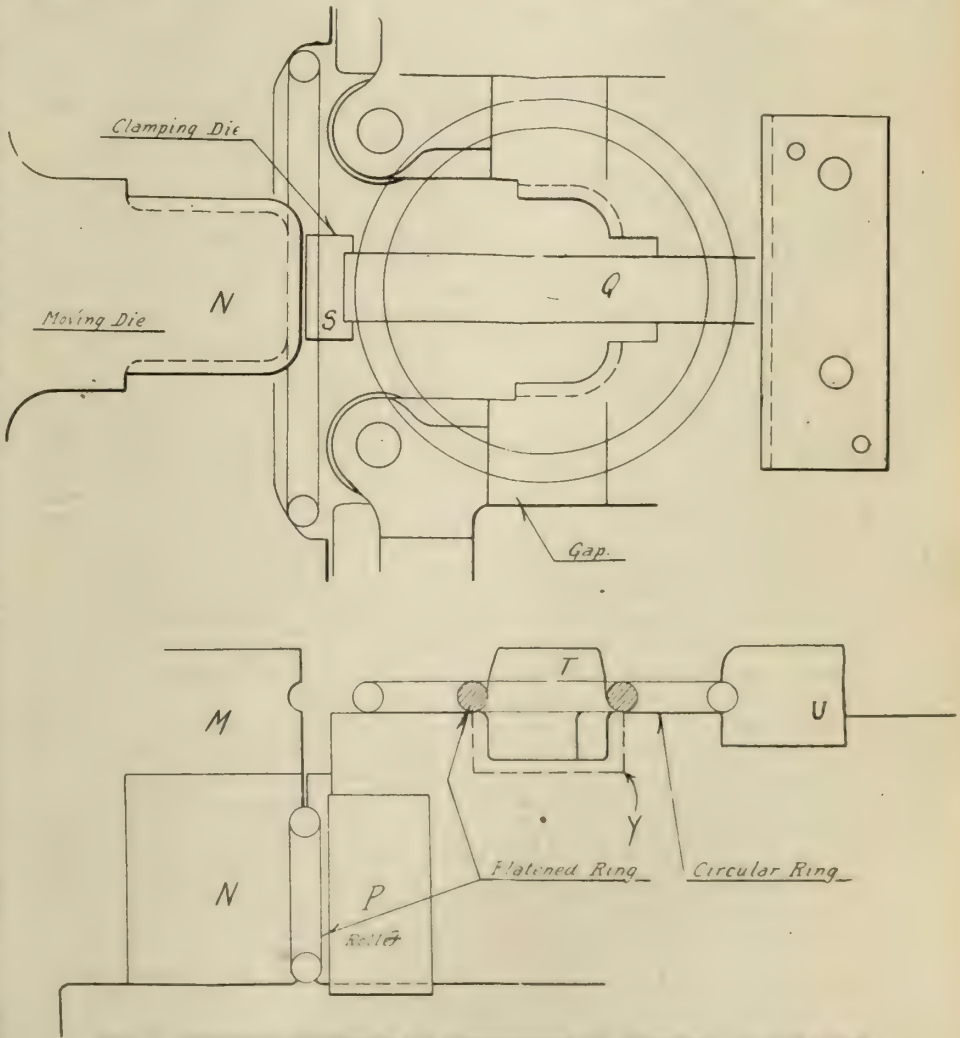
well above the diameter of the round stock of the ring, so that the ring may readily drop into place against the quarter circle radius at its base. The upper die E is correspondingly recessed, and where the weld F occurs the dies are shaped so as to spread the extra metal over a greater part of the circle than that occupied by the initial lap. The welded ring is now about 4¾ inches inside diameter.

### Final Operations

The final operations of bending and flattening the ring are performed in a bulldozer fitted with the special two-purpose dies here described. The long horizontal stroke of the bulldozer is particularly adapted to this class of work. The forming dies consist of a moving diehead G, which is bolted to the ram of the machine, and a stationary die-holder and component parts which are clamped across the bed and bear against the end thrust screws L. The moving dies are in two parts: the upper block M designed to press the circular ring into an elongated shape as the first operation. The lower block N forms this elongated ring into the final shape A as the second operation.

The stationary die-holder has a recess O fitted with inserts grooved to envelop the outer faces of the finished piece. At each side of the entrance are guide rollers P, to give an easy bending movement to the yielding piece. In the center of this die-holder a slot is provided for the slide bar Q, the movement of which is controlled by two heavy adjustable tension springs acting on the compensating bridge R, fixed to the end of the bar. The front of the bar carries a clamping die S, which is normally pressed out ahead of the rollers, but which forms part of the forming die when pressed back. On the top of the bar slides is the centering block T, around which the ring is flattened against the stationary piece U, grooved to suit, and forming a tangent to the semi-circular ends of the flattened ring. This block has a stem V that works in a groove under the rear piece U, and the block takes part of the forward movement of the slide bar by contact of the stem with the projecting lip W. The front part of the stationary die has lugs to which the stripped plates are attached. The stripped fingers run in side grooves of the lower moving die. The rear part of one of the strippers is shaped to serve as a gauge for the flattened ring when inserted for the final operation. The bodies of both die-holders and moving die-head are made of cast iron, and parts coming in contact with the red hot ring are made of high speed steel.

Fig. 6 shows a sketch of the sequence of operations for the forming of the ring. With the moving die-head withdrawn the slide bar Q and clamping die S project ahead of the stationary die, and the centering block is in its forward position. The heated circular ring is placed over this centering block, the clutch tripped and the upper moving die M flattens the ring around the centering as it moves toward the rear block U. When the ram recedes the flattened ring is removed by tongs on its projecting end. The ring is now turned into the



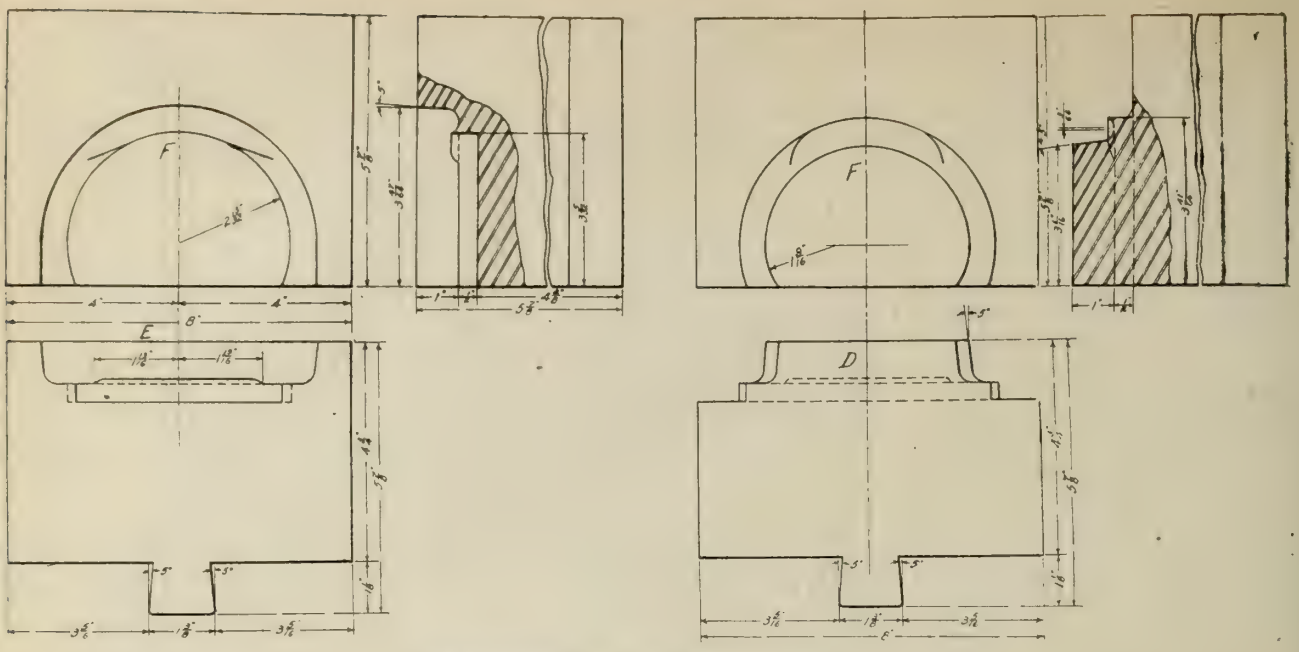


FIG. 6.—SHOWING SEQUENCE OF OPERATIONS IN FORMING OF THE RING.

THE WELDING DIES USED ON THE RING.

vertical plane and set in front of the rollers, the far side against the gauging face of the stripper. The clutch is again released and the lower moving die N advances, gripping the center of the ring against the clamping die S, while the ring is bent around the rollers P and forced into the dies O. As the ram retires, the clamping die, under the tension of the controlling springs, keeps the bent ring on the moving die until the fingers of the stripper retard the piece and permit it to fall clear on to the sloping flange of the stationary die. The centering block on top is meanwhile advanced to its forward position ready for the following ring to be flattened.

Two rings may be passing through the machine at the same time, but as it is advisable to place the weld so that it will come on the straight portion of the finished work, it is probably more advantageous to make one operation per stroke, as the machine can then be run continuously.

## WHY DID IT BREAK?

MANY a steel treater and tool designer has asked himself this question after the failure of some particular part which was being hardened. Sometimes he discovers the trouble, but generally it remains an unsolved mystery.

At a joint meeting of the American society for steel treating, Toronto chapter, and the American society of mechanical engineers, Ontario section, held in Toronto February 11, this subject of breakage was ably discussed by Howard J. Stagg, assistant manager of the Halcomb Steel Company, Syracuse, N.Y. His talk was illustrated by lantern slides, and splendid examples of failure, due to various causes, were shown on the screen.

Particular stress was laid on the point of inefficient design, and the mechanical engineers came in for a good natured call down. "Engineers in general," commented Mr. Stagg, "are well aware that sharp cornered keyways, sharp angles and sudden change of section are all to be avoided as far as possible, yet they will persist in calling for them on their drawings."

To prove that keyways are a real source of danger, several slides were shown which clearly illustrated that the failure of parts containing sharp cornered keyways always occurred, and started from the sharp corners. The illustrations covered varied styles of work and proved that the point raised was absolutely correct. In every example the remedy was the same, namely, to place a small radius at the bottom of the keyway. The speaker claimed that some concerns were finding it a good plan to make their keyways semi-circular in shape, rather than with the regular straight edge.

Further slides brought out the danger of damaging a piece of steel while grinding. "Even the slightest indent, hole, nick or notch in a piece of steel that has to be hardened is dangerous," said Mr. Stagg. He went on to prove this statement by showing examples of parts that had cracked owing to all of the above mentioned causes. The grinding examples were particularly interesting, and the slides clearly proved that a wheel should be carefully selected to prevent this trouble arising. Not only must the wheel be selected as to grain, etc., but the surface, or face, of the wheel should be kept true and clean. Dirt causes friction, friction causes scratches, and providing the dirt is hard enough, and large enough, the nick becomes almost a small groove. It was surprising to note the amount of damage that could occur from these small cracks.

### Never Hurry

The danger of hurrying hardening operations was also covered. "Never hurry a job," commented Mr. Stagg. "Heat slowly, uniformly and thoroughly, to the minimum temperature required for tempering. Quench and draw the temper immediately after hardening." This statement was repeated time after time during the evening, and as the speaker frankly remarked, "Let that thought sink in, and the evening has been well spent." Various slides were shown that proved conclusively this danger of hurry.

In order to emphasize the importance of slow and even heating, a chart was shown that depicted the fact that up to a certain critical point steel expanded. After this point the steel contracted for a short time, then expanded once more. There is no need to go further into this at the present time except to say that the speaker gave these figures to prove his contention for the necessity and advisability of drawing the temper immediately after hardening.

If a volume in its original state is, say, one inch, the volume after quenching is 1.00077 inches. When drawn immediately after hardening, the volume returns to .99999 almost to infinity, or, in other words, returns practically to its original state, this, of course, relieving internal stresses.

The various slides throughout the talk were of such real merit and value to the designer and mechanic alike that we made arrangements to secure photographs of the best of these, together with detailed data on each example. This will be published in a later issue and should prove of decided interest to our readers.

Officials of the Canadian Government Merchant Marine recently announced a general reduction in cargo rates on goods and materials leaving Canadian ports for Great Britain. The new rate will be 40 cents a cubic foot, or 75 cents per hundred pounds. This is a reduction of about 20 per cent. over the rates formerly in force.

# Long Line, Group, and Individual Drive

## The Question of Transmission is a Many Sided One. The Three Methods Are Discussed, Actual Figures Being Given to Illustrate and Verify the Statements Made

By R. F. JONES, Research Director for Leather Belting Exchange *

THE question of the most economical and efficient method of transmitting power from the prime mover to the machine tool is still one which has many reasonable arguments for each system of transmission. The industrial engineer has to study the question from its many sides and decide which is the best for his plant, according to the individual problems which he has to solve.

The three systems in use at the present time are:

1. The long line shaft, which drives the individual tools, and, which in turn is driven by the prime mover.

2. The electric system of driving each tool by an individual electric motor.

3. The electric system of driving certain groups of tools by an electric motor through a short line shaft.

The long line shaft running from one end of a factory to the other is the time honored method of distributing power throughout the plant. This system is still in use for many processes of manufacture, and probably will continue to be used for a good many years to come in certain kinds of plants where it is especially well adapted to the work. But for machine shop and machine tool driving the long line shaft is practically obsolete. The line shaft has to be too long to permit good alignment of the bearings, so that the friction loss is apt to be large. However, it has the advantage of low initial cost, and in these days of excessively high prices this is a serious consideration.

For the purposes of the ordinary machine shop or factory the choice of drive now lies between the individual motor system or the group system of driving. In either case electrical power is practically always used. Often an engineer can employ both to advantage, the group system being used for the bulk of the smaller machine tools, and the individual motors being used on the few larger machines, such as those requiring above ten horse-power. The engineer in making his decisison will be governed largely by such considerations as first cost, maintenance, depreciation, provision for extension, efficiency of the system, sectional operation, flexibility as to location of tools, and positive application of power.

Individual electric driving of each machine tool came into practice some years ago and gained much headway, but in recent years the trend has been more to the group drive, with the individual drive for the larger tools. The initial cost of the individual drive is much greater because of the high cost of manufacturing small units and because of the large total power required.

The following remarks are from a well known encyclopedia and state the general trend of opinion on this subject:

"The individual motor drive with a separate motor attached to each machine makes an installation expensive, and although this form of drive is the most flexible it is frequently giving way to the group drive for light machine shop work.

"The horse-power of the motor required for group driving is much less than the sum of the horse-power required for each individual tool. The reason for this is that some of the machines are idle, and others consume only a small amount of power at the same time, when the remaining machines absorb the maximum amount. Actual experience has shown that for group driving in an ordinary machine shop, a motor of ¼ or 1-5 of the total H.-P. of the motors required for the individual machines is sufficient."

### THE THREE SYSTEMS

The systems discussed are as follows:

The long line shaft, which drives the individual tools, the shaft being driven from a prime mover; the electric individual motor drive; the method of driving certain groups of tools by an electric motor through a short line shaft.

It is easy to see that the initial investment is materially reduced by using the group system, because the added shafting and belt required is not nearly as expensive as the large number of small motors. Experience has also proved that maintenance and depreciation costs are also less with the group system.

### Advantages Claimed

The principal advantage claimed by advocates of the individual electric drive is that it gives a closer speed adjustment of the tool to the work, so that the workman can be running his machine at its maximum output a greater proportion of the time. Most of the smaller individually driven machines are driven with belts by small constant speed induction motors. In this case no advantage in speed regulation of the machine tool is gained because we still have to use gears with a fixed number of speed changes, the same as we would if the machine were driven from a countershaft with cone pulleys.

With the direct current motor driving through gears we can obtain some speed regulation between the steps of the gears by changing the field strength of the motor. However, closer speed regulation than we get with the modern lathe, where eight speeds is common, and where sixteen can easily be obtained with a two speed countershaft, is a very doubtful advantage, because of the many other variables such as the shape, sharpness, and composition of the cutting tool, which affect the rate of production.

In order to eliminate the cone pulley or the gears, builders of electrical machinery have designed motors for use with machine tools, whose speed range is as great as six to one. These motors are intended to drive the machine direct, and accomplish speed changing by field and armature control. In machine tool work such as lathes and boring mills, the rate of cutting the metal is about the same for any one metal regardless of the size of the piece. If the piece is large the rotary speed will be low, but the motor will have to supply just as much power at this low speed as it does at the highest speeds. Since the power delivered by an electric motor increases with the speed, it is apparent that for a motor to deliver full power at its slowest speed it will be capable of delivering unnecessary power at its highest speeds.

Mr. Alexander Gray, Professor of Electrical Engineering at Cornell University, in his book entitled, "Principles and Practice of Electrical Engineering," gives examples to show the increase in cost as the speed range is increased. He states that a ten horse-power, 220 volt, 1,200 R.P.M. motor will cost 66% more if it is built to give ten horse-power at speeds ranging from 600 to 1,200 or a speed ratio of two to one, and 160% more if the same power is desired at speeds from 300 to 1,200 or a speed ratio of four to one. A four to one ratio is a small range of speed for ordinary machine tools, and yet it increases the cost of the individual motors two and six-tenths times when this system of speed control is used. It is evident that this extra initial cost will not be justified in the average shop.

The multiple voltage systems, which are designed to give the speed changes, by using several different terminal voltages also require oversize motors, so that the increased investment required

*A paper read before the National Association of Leather Belting Manufacturers.

by such a system is also not justified in the average shop.

### The Group Drive

On the other hand the group drive requires only one motor for each group which runs at a constant speed so that either direct or alternating current can be used. This motor drives a short line shaft, which in the modern installations is hung with ball bearing hangers. Line shafts of this type waste very little power, and are a great contrast to the old type which ran the entire length of the shop, and sometimes used up thirty or forty per cent. of the power of the prime mover. As the large motor is five to ten per cent. more efficient than the small individual motor and is also running much closer to its most efficient load, it will save enough power to more than make up for the small loss in the line shaft. Several tools of the same kind are usually grouped together, and space can be left for the addition of new machines. If the engineer wants to put in an additional tool here and there he can easily add to the group. If it is necessary to install several new machines they can be put together and a new group started. In this way expansion is readily accomplished.

The individual drive has a slight advantage if only one machine is to be operated. This is usually provided for by having a few of the individually driven tools in the shop to be used when the groups are not running. With such an arrangement we combine the advantages of the individually motored machine with the economy of the group system.

Advocates of the individual electric drive claim that it has an advantage when arranging the machines to fit in with the continuity of the manufacturing process. A good engineer when originally laying out a plant by the group system will have little trouble in placing his machines so that they accomplish this end. The overhead shafting and the vertical belts are often considered as a disadvantage because they interfere with the light. This may be true in old fashioned and poorly designed shops, but with the modern high ceilings and large windows such as we find today it is rather absurd to say that a reasonable amount of belting and shafting will seriously interfere with the light.

### The Belt as a Medium

The group system also has the advantage of having the power transmitted through belting. A belt is a very valuable medium to have between the source of power and the machine, because it often acts as a safety device by slipping off when the machine becomes heavily overloaded. The belt also cushions the machine tool by stretching and slipping when the power is suddenly applied. At first many individually driven machine tools were direct driven by gearing to the motor. This gave an advantage of positive power at all times, but it was soon found that without the belt, serious damage was apt to be inflicted on the tool or the motor when subjected to heavy overloads. Nowadays a short belt is often used instead of the gears, but since the motor is usually high speed and the motor pulley small, the belt has to be kept very tight. Journal friction and wear on the belt are increased thereby with a corresponding increase of maintenance costs.

Too often the salesman of the individual drive will compare the modern efficient methods of the electric transmission with older mechanical installations in which the line shaft losses rose to a high figure. To be strictly comparable the equipment should be modern in both cases. These unfair comparisons have led many people to believe that an individual motor for each machine gives the most efficient and economical transmission. The modern well informed engineer knows that the group drive system combined with a few of the larger machines, individually driven, will cost less and show greater economy of production than the shop equipped throughout with individually driven machine tools.

Frederick Taylor, widely known industrial engineer and famous for his work on shop management, published the following statement in the Journal of the American Society of Mechanical Engineers in 1909:

"The belt is one of the oldest and most commonplace of the elements used in shop practice, so that engineers designing new establishments or remodeling old ones, who wish to be up to date, naturally incline toward the use of the electric drive rather than the belt. There is no doubt, however, that this has led to the use of the electric drive in many instances where the belt would be far more economical and satisfactory in almost every way.

"In the average machine shop, for instance, the writer is prepared to say that for more than half of the machines the belt drive can still be used with greater economy and with more satisfactory results than the electric drive; only on the assumption, however, that the belting is systematically cared for.

"It has been shown by an accurate record kept through a long term of years that in the average machine shop the average cost per belt per year is $2.25. This includes the original cost of the belt plus all the labor and materials used in maintaining, repairing, and cleaning it throughout its life. No similar statistics for the maintenance and renewal of the motor drive seem to be available, but I think that no one will contend that the latter can in any way approach this economy.

"In large machines economy lies on the side of motor drive in many instances, but with almost all small machines the belt drive should still be used."

Mr. Taylor was regarded as an authority on shop management and he has done some of our best work along this line. He was the first man to make a scientific investigation of manufacturing problems, and his belting records are regarded as the best and most extensive information obtainable on the economic use of belting. His endorsement of the belt drive should carry great weight with the manufacturer who is planning a new shop.

In view of these facts it is apparent that the group drive offers practically all of the advantages of the individual drive, besides having the big advantages of much lower first cost, slower depreciation, and lower maintenance charges.

### POINTS BROUGHT OUT

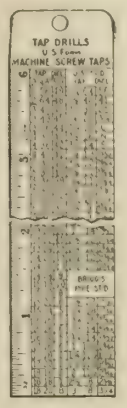
That the horse power of the motor required for group driving is much less than the sum of the horse power required for each individual tool.

That the overhead shafting is not such a disadvantage as it is claimed to be, especially in modern shops where the lighting conditions are more favorable.

That belts to be efficient should be properly cared for.

That the cost per belt in the average machine shop is $2.25 per year. This includes original cost, plus labor and material used for maintenance, repair, etc.

That in large machines economy lies on the side of the motor drive, but on small machines the belt drive should still be used.



### WOOD TURNING TOOL

A handy tool for turning wood on slow-running lathes is described and illustrated in British Machine Tool Engineering. It takes the form of a thin conical cup of steel, with its base uppermost. The cup is fixed to a holder and is used in the slide rest. It is said to give a good clean finish, even to soft wood, when the work is running at speeds usual in metal turning. To give the finest finish the tool should be set to such a height as to give very small clearance. For the final finish of wood rollers, either solid or lagged, a good method is to use a metal hand plane set to a very fine cut and held at an angle of about 45 deg. The plane should be made to slide cornerwise along the roller with only a small part of the middle of the plane iron in action. Carefully manipulated, this will give a finish equal to that which a carpenter gets planing boards on the flat.

The output of peat in Sweden is stated to be rapidly increasing. During the present year considerably over 400,00 tons have already been dug, corresponding to over 200,000 tons of coal.

# Have You Tried This Contest Yet? If not--- Do so Now

Below will be found twelve references to advertisements in this number. To the sender of the first correct set of answers to these we will forward one of these scales.
To win one is not difficult, and at the same time you will add to your store of knowledge. Read the details given below.

The scale is 6 in. long and is made from finest quality steel. One side is marked in 32nds, the other side in 64ths. A table of decimal equivalents is also stamped on one side, and a table of tap drill sizes on the reverse side. This scale is well worth securing.

## What You Have to Do

We publish every week a number of interesting facts or statements selected from the advertising pages for that week. The selections for this issue are given below. Read these through, then turn to the advertising section and see if you can pick out the advertisements to which they refer. The work is interesting, it will train your powers of perception and of memory, it costs you nothing, it will make you better acquainted with the various lines of machinery and tools in the market, and with perseverance you are bound to win one of these useful scales as a prize.

G. A. Todd, Penetanguishene, Ont., is the winner for the January 27th issue. He was the only reader with all answers correct. Quite a few were out on query No. 12, which read "A suggestion worth considering." On page 79 of that issue were these words: "If what you want is not here, write us and we will tell you where to get it." This was, to our mind, a suggestion worth considering. How about it? We appreciate the interest taken by readers in this contest, and will in every possible way make it interesting.

**CONTEST FOR FEBRUARY 17TH ISSUE**

**Contestants are required to write us, stating to which advertisements we refer in this number.**

1—Something that claims to make more—yet with less?
2—Something specially adapted to hard usage.
3—A pertinent question.
4—Something that requires no patterns.
5—How to save three important things.
6—Something that although not new is guaranteed.
7—How to solve your metal cutting problems.
8—Something that can be depended upon under all conditions.
9—An important request.
10—Something that actually has steel fingers.
11—A product of smooth appearance.
12—How you might cut 25 per cent. of your cost in castings.

**These are Correct Answers for List from January 27th Issue:**

1—The Consolidated Iron & Steel Mfg. Co.
2—Canadian Machinery.
3—Cleveland Pneumatic Tool Co.
4—Armstrong Bros. Tool Co.
5—J. C. McLaren Belting Co.
6—Canadian Asbestos Co.
7—John Hepburn, Ltd.
8—Canadian Driver-Harris Co., Ltd.
9—Gisholt Machine Co.
10—Landis Tool Co.
11—Armstrong-Whitworth of Canada, Ltd.
12—Canadian Machinery Buyers' Directory.

## Closing Date for This Contest is March 10th.

# John Gets a Lecture on "How to Run a Lathe"

## The Operation of a General Purpose Lathe—Text Book Lore and Actual Conditions in the Shop Sometimes Differ—Supporting the Work—Points to Watch—Using Plug and Ring Gauges.

By J. DAVIES

ONE of John's ambitions in life was to operate a lathe so that when the foreman told him they were getting pretty well caught up on planer work and asked him to operate a lathe he readily agreed to do so. When he got home to his father that evening he said, "I am going to try to run a lathe tomorrow and I want you to give me a free lecture on lathe work."

That evening John and his father got together for a talk. "Don't you think that the lathe is the most important machine in the shop?" John commenced.

"I couldn't say any machine was the most important," remarked his father, "but without accurate lathe work no modern machine shop can exist. It is capable of a larger variety of operations than any other machine in the shop, and it requires considerable care and skill to become a good lathe hand. It has been found that many operations can be more economically performed on a lathe which is specially adapted for some specific purpose, so that we have a number of lathes that are really special types in their own line, such as axle lathes, wheel lathes, turret lathes, etc. We will take for our talk the operation of a tool room, engine, or general purpose lathe, as any man that can operate a lathe on general work will have no difficulty in operating a special machine, the main principles being the same.

"Consider first the turning of a plain round bar, and deal with conditions as we find them; there is a world of difference between actual conditions as you find them in some shops, and what you read about in text books. This bar might have been cast in the foundry, cut off with the shop saw, or as it often happens, the saw was busy with another job, so the blacksmith just nicked it round with a chisel, and broke it off, leaving a nasty ragged end. The first thing to do is to face, or cut off the bar to the proper length. If the bar has a ragged end, don't waste time finding center with compass or jenny-legs. Put the bar in the chuck, passing the bar through the hollow spindle of the lathe, and leave just enough sticking out of the chuck to face or cut off.

### Supporting the Work

"If the lathe spindle should be hollow you will need to support one end with a steady head. If there is sufficient length to cut off, use a cutting-off or parting tool, but if there is not more length to cut off than the width of the cutting-off tool, use a side tool. Don't use a cutting-off tool any longer than is necessary, the length should slightly exceed half the diameter of the bar to be cut, the width from 3-16 in. to ¼ in. After facing the end the most convenient tool for centering is a combined drill and countersink to fit the tailstock, which is then fed into the bar with the tailstock spindle. A very useful tool is a centering tool. It is made of standard size tool steel hammered out like a flat drill, used in the lathe tool post like any other drill. It is indispensable for truing up the centre of an old shaft. The centering drill or tool should be at an angle of 60 deg., to suit the angle of the lathe centres.

"It is important to have round, smooth centers at the correct angles, as it is impossible to do good lathe work with bad centers. If the center is not made with a combination drill and countersink, a small hole should be drilled into the bar to ensure that the center will not ride on the point when the center hole wears a little."

"How about the centering machine we have in the shop, why not use it?"

"Use it by all means when you can, but you will often find the conditions just as I have described them. The first operation is to cut to length, then center; don't have your centers in a small projecting piece that will be cut off after the job is done, but rather leave your centers in the finished job, then it will be very convenient if it is necessary to put the piece back in the lathe at any time.

### Ready For Turning

"After centering we are ready to begin turning. Put a lathe dog on one end and lubricate the center hole at the other end. The tailstock must be set to the proper position for holding the work between the centers; don't wind out the tailstock spindle any further than is necessary, and have the pressure on the spindle such that the work can be turned by hand, but not loose enough to have any end play, or fall down by the weight of the dog. Be sure that the tail of the dog is quite free in the slots of the faceplate of driving plate. A common mistake for beginners is to have the tail of the dog held up in such a manner as to hold the work away from the live center, thus causing the work to run untrue. Some prefer to drive a round bar with a dog with a straight tail, driven by a pin bolted in one of the slots or holes of the face plate. This gives a direct drive and avoids all possibilities of twisting or ramming of the tail in the slot.

"The next thing is to see that the bar is running true. It may be true at the ends, but bent in the middle more than the amount of stock to be turned off. If there is no special straightening machine, and it is seldom there is, it can be straightened between the centers of the lathe either by the use of a jim-crow or with a bar or lever, unless the job is a heavy one, when it might be necessary to take it to the blacksmith shop. Straightening a shaft cold in the lathe stretches the metal and sets up a kind of internal strain in the metal, so that it will very seldom remain true after being cleaned up with one cut; never try to finish a job with one cut that has been straightened in the lathe. If there is an old lathe that can be used for straightening, so much the better, as straightening between the centers is bad for the lathe and should be avoided if possible.

"In using the jim-crow, revolve the work round in the lathe and hold a piece of chalk against it to find the high spots. Put the high spot or bent part at the top, right under the screw of the jim crow, and tighten up the screw until you judge you have taken out the bend. Test the bar by revolving it round again, and repeat the operation until you have the work true enough to turn up. The work can also be straightened by putting a bar or lever under the work in such a way that when the bar or lever is pushed down the work is sprung up, only in this case the marked or bent part must be down. After a few trials it will be found to run nearly true. If the bar is too stiff to be straightened by simply springing it with a bar, give it a few sharp blows with a hand hammer on the top of the shaft while holding it up with the bar. The hammering should be light or the bar will be found to be bent the opposite way.

### Watch the Centers

"If the job has been straightened between the centers, examine the lathe centers before starting a cut, putting the lathe on top speed to see if the live center is true. If the live center is slightly out of truth, although a piece of work turned out on it might be straight and true, or a number of different sizes were turned, they might all be true with each other, they would not be true with the center hole in the shaft. If, however, the dog was loosed off and clamped again in a fresh place, or the piece was turned end for end, it would

not run true, so that it is very necessary to have a true live center, especially when work passed from one lathe to another before being finished.

"The dead center should always be hardened. The live center may, or may not, be hardened, according to circumstances. If a live center is turned, hardened, and then put back into its place the chances are that it will not run true, owing to unequal expansion and contraction in the operation of hardening and tempering. To use hardened live centers they ought to be ground in their place by a special grinding attachment for that purpose. On the other hand, while a soft lathe center can easily be turned up and tried it can easily be bent or bruised and made untrue. If you are working in a shop that has grinding attachments for the lathe, by all means harden the live center, but if not, better leave them soft, or have the temper drawn just enough to turn.

"Even though the center is ground perfectly true, it will be found that after removing it and putting it back it may not run true. This is due to the fact that the center hole in the spindle is not always absolutely true; therefore, when turning the center always make an identification mark on it, and on the lathe spindle to enable you to put them back in the same place.

### Centers Must Be in Line

"In order to turn a parallel bar between the lathe centers it is necessary for the lathe centers to be in line with each other and with the line of movement of the tool rest. To test this, use a bar about 2 ft. long with a small portion at each end turned to the same size or slightly less in the middle for clearance; set the tool to just touch one end of the bar, then run the carriage along to the other end, move the tailstock whichever way it needs to go until the tool exactly touchhes either end of the bar. If the end of the tailstock is not already marked, make a reference mark with a fine chisel, so that it can be put back to the same place if you need to move it at any time.

"If you have no test bar, or no time or opportunity to make one, try out the centers by using the job in hand. Turn a small portion at each end to the same size, then, instead of undercutting the middle for clearance, set the tool to touch the turned portion at the live center end, take the job out of the centers, or if it is a light job turn back the tailstock center enough to allow you to run the carriage to the other end against the centers and test as before. If the job is too heavy to conveniently take out of the lathe, note the graduations on the cross feed screw or make a reference mark on same and see that the tool just touches each end of the turned portion when the reference mark on cross feed screw is the same. Another result of the centers not being in line can be seen by facing the end of the work between the centers, when, by placing a straight edge across the end it would be found that the end would be concave or convex, according to which way the tailstock needed to be moved, as the centers have to be exactly at right angles to the cross slide to produce a flat surface.

"Volumes have been written about the theory of cutting tools, but to specify the exact size and shape of all the different lathe tools is too big a job for me. The shape of the tool depends entirely upon the nature of the job and the kind of metal to be cut. Generally speaking, the softer the metal to be cut the sharper the tool, while with hard metal there is less clearance. Cast iron can be cut with a broader nosed tool than wrought iron or steel, because the chips break off more readily and thus relieve the tool, allowing a broader nose and rougher feed.

### The Height of the Tool

"It is important to have the tool at the right height, so in order to insure this make a mark on the tailstock spindle exactly the height of the lathe center, put a parting or cutting-off tool in the tool post and adjust it to the exact height of the lathe centers. Now slightly press it against the tailstock spindle and run the carriage along, making a permanent mark on the tailstock spindle about 2 inches long. This will be found very convenient, especially when setting the tool for taper work.

"Set the tool a little above the center; by using the reference mark on the tailstock spindle you will know exactly the height of the tool in relation to the lathe centers. The larger the diameter of the work the higher you can set the tool above the lathe centers with advantage. Avoid setting the tool below the center, because if there is any lost motion in the screw or slackness in the slide, the tendency is to pull the tool into the work, when, without warning, the job will climb over the top of the tool and jump out of the centers. Fasten the tool in the tool post as close to the cutting edge as possible and keep it quite clear of the work while doing so.

"Making the first cut is entirely a matter of judgment. Try the calipers on it as soon as you can, but be careful not to take too much off at the first trial, as there are no lathe putting-on tools. After adjusting the cut to the right size start the feed and let it run half way up the bar, then remove the work, run the tool back to the starting point, replace the work in the reverse position, and let the same cut run over the part that has not been turned. The work will now be the same size at both ends and the cut will meet in the center. If the live center should not run perfectly true it will be least noticeable where the cuts meet in the middle of the bar.

"If it is necessary to take a number of cuts, and a very accurate job is wanted, it is best to reverse the work at every cut so that the centers will wear even. Before clamping the dog to a finished surface, place a piece of sheet brass about the size of a postage stamp under the setscrew to save marking the surface.

### The Finishing Cut

"Always grind the tool before taking the finishing cut. Finishing tools, as a rule, will stand a little more rake on top than roughing tools. Take the finishing cuts with a fine feed and at as high a speed as the tool will stand up to, considering the diameter and length of the job being done.

"A good lathe hand can, with care, detect a difference of .001 inch with an ordinary pair of spring calipers. They should be held lightly between the thumb and fingers of the right hand, while the thumb and forefinger of the left hand hold one of the caliper points stationary on the piece to be calipered. Gently swing the other point across the work and move it in and out until you find the place where the point has the least travel. This is the smallest diameter that can be found, and is at right angles to the axis of the shaft. When this point is determined let the calipers pass over with a very slight pressure; some prefer to let the calipers pass over without touching, noting very carefully the amount of side play or travel of the calipers at the smallest part and then have the same conditions exactly on the plug or piece that they are measuring from. This is probably the most accurate way, but it requires some experience as it dpeends more upon judgment than sense of touch.

"If the shaft has to be turned to fit a ring gauge it must of necessity be a few thousandths less than the ring gauge, depending upon the diameter, as a ring gauge of 3 in. diam., for instance, will not pass over a 3 in. plug, although sometimes plug and ring gauges are made to pass over each other, especially homemade ones.

"When using the plug and ring gauges remember that the kind of fit that the ring and plug gauge make with each other is exactly reversed in the work. If the plug and ring gauge will not go together the work made to them must. If the ring and plug will pass over each other the work may not, as it would depend on whether the work was a closer fit than the plug and ring gauges are to each other. These conditions apply when the hole in the work is made to fit the plug, and the shaft turned to fit the ring, so that if the plug and ring gauges were being made for parts that were wanted to be a forced or driving fit it would be necessary to make the gauges so many thousandths slack.

"But look, it's 11.30 p.m.—Off to bed, or else you'll be so sleepy in the morning you'll fall on top of the lathe and ruin all the benefit of my talk."

# DEVELOPMENTS IN SHOP EQUIPMENT

## WEB THINNING MACHINE

The Herbert Hunt & Sons, Ltd., Old Trafford, Manchester, England, have built the machine shown at Figs. 1 and 2 to meet the requirements for an accurate and reliable twist drill point—sharpening and web-thinning machine. The principle upon which the construction is based, is to revolve the drill continuously in one direction and to impart automatically to the drill when so rotated, the necessary motions to give the correct clearance to the lips, also to feed the drill forward a predetermined amount once during each complete revolution, the mechanism for giving the correct form repeating its movement to both lips. The machine will grind any quantity of drills automatically to one length. This is a feature that will be appreciated where multiple spindle drilling machines are being used.

The machine is built in two types, one a full power model, in which all motions are operated by power and only requires the operator to reload the drills; the other is a hand machine, which embodies the same motions, but having only the grinding wheel driven by power. In the former type of machine a point-thinning arrangement is fitted for thinning down the web of the drill at the cutting point. On the latter type this arrangement is only fitted upon request, although all provision has been made for the same.

The machines are entirely self-contained, being driven by fast and loose pulleys embodied in the wheel head, therefore no countershaft is required. A centrifugal pump, together with necessary piping provides ample lubrication to the grinding wheel. This lubricant is returned to the supply tank after use.

As previously stated the various motions necessary to grind the correct clearance to the cutting lips are produced automatically. In the case of the fully automatic machine these motions are driven from the grinding head spindle, and in the case of the hand machine they are produced by the operator revolving a hand wheel which replaces the crank handle seen to the left. No special settings are required for the various range of drills. The drill is chucked in the work spindle S, which is formed at the end into an ordinary socket. A quarter turn of the knurled nut seen on the spindle secures the drill in position. During this action the sleeve bush A is locked against rotation by the latch as seen, so that the correct relationship between the drill and the cam motion may be ensured. The hand wheel is now tightened which locks the spindle and as the automatic motion is engaged, the latch automatically comes out of engagement and grinding proceeds. The drill is given a swivelling and a reciprocating motion which causes the work spindle as it rotates to advance and retire from the grinding wheel.

In the case of the swivelling motion, the action is produced by worm and worm wheel and bevel gearing, driven from the main spindle, which gives motion to a vertical shaft mounted on the swivel slide B. To the end of this vertical shaft is fitted a crank disc, and by a connecting rod L is coupled to a stationary part of the machine M. This motion causes the swivel to pivot round the vertical axis of the drill support bush. The reciprocating motion is produced by means of a face cam E which makes contact with a fixed roller. The cam is mounted at one end of a horizontal shaft D which is rotated by bevel gears from the vertical shaft. At the other end of the camshaft is fitted a yoke C which couples up with the sleeve A. Thus as the camshaft rotates, the work spindle, through the medium of the coupling yoke, is moved backwards and forwards. By means of the spur gears F N a 2-to-1 ratio is obtained, which causes the work spindle to rotate once for every two rovolutions of the camshaft, thereby repeating the reciprocating motion for each of the drill lips.

A cross slide is fitted which automatically moves the work to and fro across the grinding wheel face. The slide can be adjusted into various positions by means of a small hand wheel. The motion is taken advantage of to effect an automatic feed which is of the simple ratchet type, and adjustable from 0.001 to 0.015-inch advancement to one revolution of the drill. It is arranged so that it will automatically trip as desired.

The point-thinning arrangement is made to carry the drill at the correct angle to the grinding wheel. It is provided with a stop which supports the end of the drill, and a finger to engage with the cutting lip of the drill. The motion is given by a lever operating the slide and passes the drill beneath the grinding wheel.

Three grinding wheels are supplied, each mounted on its own bush. Vertical adjustment is provided to compensate for wear of the wheel and the size of the drill being thinned.

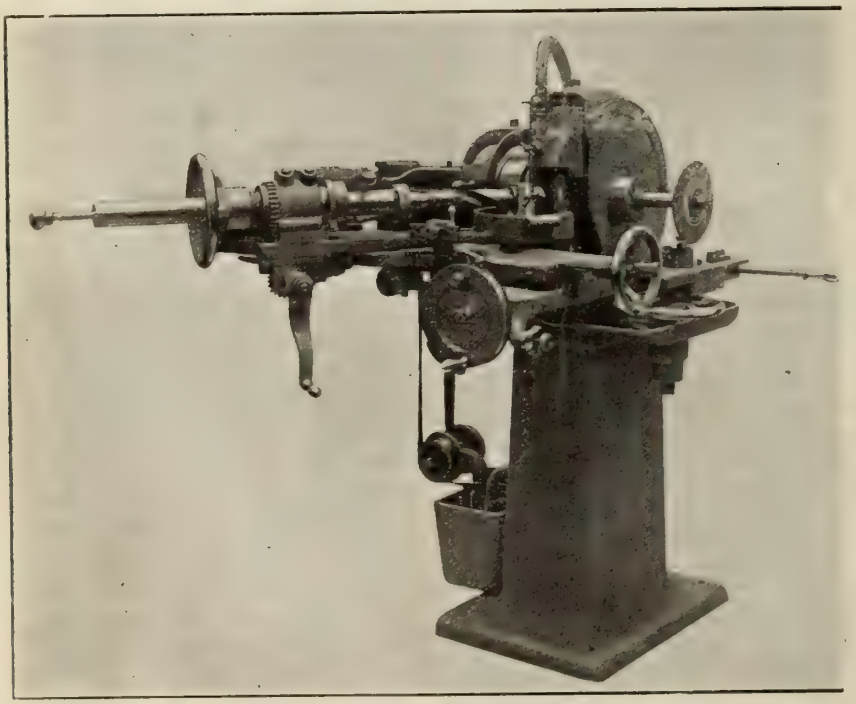


FIG. 1.—A GENERAL VIEW OF THE WEB THINNING MACHINE.

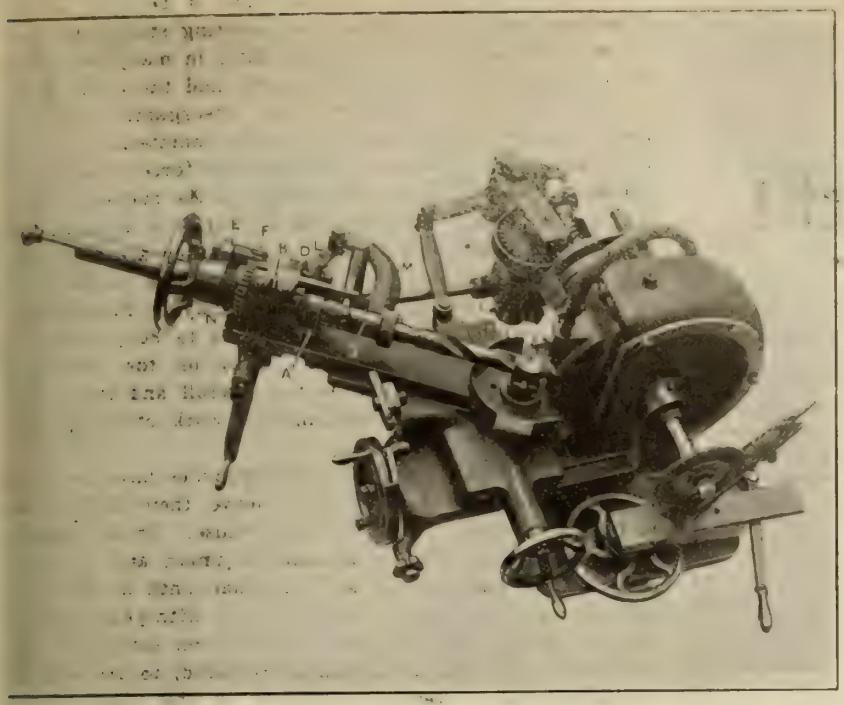

FIG. 2.—A PLAN VIEW OF THE WEB THINNING MACHINE.

# NEW THINGS IN MACHINE TOOLS

### NEW STYLE VICTOR DIE HEAD

The Victor Tool Company have redesigned their "D" head, adding certain improvements and classifying it as "style E." The tools are adjustable for variation of thread fit. The shanks are hollow for long work. Provision is made for extension of the dies through the cap when cutting close to shoulders. Internal or external tripping may be provided. The head is made entirely of steel. At present the head is made in two sizes, the range being from ⅛ to ½ inch and from ¼ to ¾ inch.

### STAGGERED-TOOTH KEYWAY BROACH

A specially designed keyway broach has been brought out by the Velco Manufacturing Company, of Greenfield, Mass. The broach is made from a solid bar, the staggering being obtained by milling the teeth from either side and in such a way that the cutting edges of the teeth overlap, thus making a clean cut. The teeth are deeply cut and made with a large radius, giving extra strength and chip clearance. The cutting faces slant in opposite directions, which gives a shearing cut and equalize the side thrust on the bar. The broaches are made in all standard sizes.

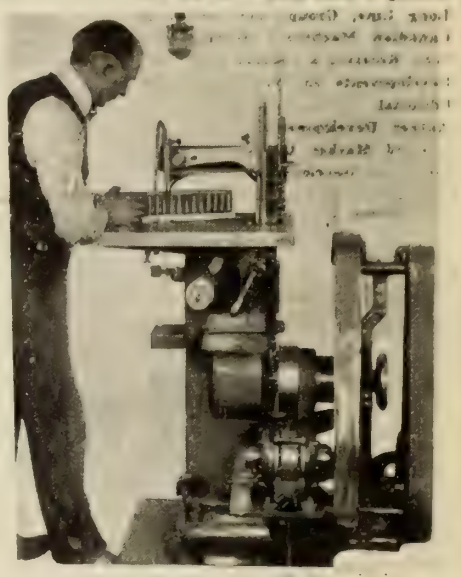
### LAMINATED SHIMS

The Laminated Shim Company, of New York, has recently placed on the market a specially constructed shim that is made up of thin layers of metal, so that shims of any desired thickness may be obtained by simply "peeling off" the number required for the necessary thickness. It is termed the "Fit All" owing to its adaptability to fit any style of automotive bearing with little or no trimming, the shape being decided on after a thorough study of about one thousand different bearings. The shims are made up in different thicknesses and can be supplied with two different sizes of holes.

### "MICRO" BOX TOOL FOR TURRETS

The Cruban Machine and Steel Corporation, of New York, have placed on the market an interesting design of box tool for use on screw machines and automatics. Adjustment for the tool bit is provided for by means of a micrometer attachment, graduation reading in thousandths of an inch lineal adjustment. The "V" guides are controlled by spring pressure and may be locked in position when adjusted to the diameter of the work. If desired a bushing plate, which will carry bushings of any desired size, may be used instead of the V guides. Special arrangement of the tool bit prevents the same from slipping.

### HORIZONTAL BORING MACHINE



A new addition to the lines of the Giddings and Lewis Machine Tool Company is a horizontal machine known as No. 25, with the following principal dimensions: The diameter of the main spindle is 2½ inches, the front end provided with a No. 4 Morse taper, the spindle having a travel of 13½ inches. Extreme distance between table and work centre, 20 inches. Table has a surface of 18 by 48 inches, with a traverse travel of 33 inches and a longitudinal travel of 30 inches. Eight spindle speeds are provided for, with a range from 12½ to 337½ r.p.m. There are nine feeds in either direction. Power required, 3 horsepower.

### DIE FILING MACHINE

W. D. Rearwin, Grand Rapids, Mich., has placed on the market a No. 6 die filing machine. This machine is larger than the regular No. 5 size, and is said to prove itself useful for many other purposes beside die filing.

The machine is provided with a 20-inch x 24-inch table that is 30 inches high. The slide is a forging and has a capacity to take files of random lengths up to 14 inches. The space back of the file is 9 inches and 8 inches from top of table to under side of file arm. The slide has a stroke of 7 inches and recedes from work on the up stroke. Extra arms are provided for sawing, and special filing of closed bottom dies, also for patterns where filing against a shoulder is necessary.

This machine can be furnished with motor, countershaft, or can be driven direct from the line shaft.

GENERAL VIEW OF THE FILING MACHINE

### HYDRAULIC PRESS

A very useful hydraulic press for general jobbing work has been developed and placed on the market by the Charles F. Elmes Engineering Works, of Chicago, Ill. The machine is particularly adapted to forcing, bending, straightening and broaching work, having a capacity up to 50 tons. Suitable attachments may be used for a large variety of operations. By using the lower portion of the press alone, the cylinder makes a serviceable 50-ton jack. The machine is lightly constructed and may be readily moved to any location and placed in any position desired. The press weighs about 500 pounds.

## More Metric Propaganda

CANADIAN MACHINERY has received from the World Metric Standardization Council a letter stating that the Metric Standards Bill has been introduced in the Senate of United States, and goes on to state:

> "Favorable editorial comment by your publication would aid powerfully in securing for the United States the advantages of this logical system. It is believed that the enclosed items will be of interest to your readers.
>
> "May we count on your co-operation?"

Well, that's a fair question and calls for a fair answer, and that answer is no—not for a minute.

As a matter of fact this whole metric system is a piece of propaganda. It is not wanted by the mechanical world. We have gone along famously on good old feet and inches. We have measured ourselves up against the kitchen door year after year—we bought a piece of land—we built a house—we got a suit of clothes—we made a machine tool—we made small tools and we put up factories. We drew plans and made blue prints—we laid out concessions and side lines—we built bridges, some of the largest in the world.

And say, all these were based on inches and feet and the only thing that worries some of us now is that we have to measure our business with a foot stick when we'd like to be using a yard measure.

There are bigger problems to be solved and more worthy matters to which any publication can lend its assistance.

The agitation carried on by the World Metric Standardization Council will have a fair sized job trying to explain why it should not be tagged as an ordinary nuisance.

## The Public Pays

THE action of the United States Railroad Labor Board, in rejecting the appeal of the Association of Railway Executives for abrogation of national working agreements, is a feature of industrial economics that must be paid for by the public at large.

In times like the present, when the requirements of a railroad are appreciably lessened, and it becomes advisable, if not imperative, to reduce the operating staffs, the feature of seniority, while highly commendable in many ways, nevertheless places upon the management and the executives, responsibilities and obligations that disorganize, completely, any plans for efficient production and maintenance of ordinary operations. When a reduction of force is decided on, the department heads have no choice in the matter, as to who will be retained. The question of wages is not considered. A certain number of men must go and they are deleted from the bottom of the seniority list, irrespective of their qualifications. Several 100 per cent. men may be included in the "lay off," while others of, perhaps 70 to 80 per cent., are retained. This means greater outlay on the part of the management, both as regards the payroll and the increased supervision required in checking the work of the inefficient "seniors."

During the past year railroad companies have been forced to let highly skilled apprentices leave their service owing to the enforcement of the seniority clause. On the expiration of apprenticeship the boy becomes a junior, and as a result, he cannot be employed as a journeyman until all those "senior" to him have been re-engaged. A fifth-year apprentice may be nearly 100 per cent proficient on locomotive work, but must give way, if a man is required, to one who may have had only a year's experience on this class of work. In cases such as these the company suffers heavily, as the education and training given to the boy is, in a measure, gone for naught, at least so far as direct returns to the company are concerned.

The public ask the "why" of increased freight and passenger rates. Well—the railroads, like any other business, cannot continue to play a losing game—therefore, the public pays.

## Striking Both Ways

TO what extent can a buyers' strike be successful in beating down prices? And if a producers' strike goes along hand-in-hand with a buyers' strike, which is going to win out in the long run?

Production right now is under consumption in nearly every line. There are very good reasons for this, which need not be gone into here. But available supplies are being worn down in nearly every line and are coming to the point of exhaustion. Demand is likely—almost certain to increase, because now it is at the minimum and any movement will be on the upward trend. When this starts what is going to happen?

One of the best market reviewers on the continent sums the situation up something like this:

> "When a railroad falls behind in keeping up the physical condition of its property, there sets in a cumulative deficiency of maintenance, which can only be made up by devoting for a time much more than the normal amount to this purpose. Correspondingly, there is no doubt a cumulative deficiency of production in many lines. Meantime, there is always a minimum amount of consumption going on. Probably, inventories are not as large to-day as they were three months ago. When the public finally makes up its mind that prices have reached bottom, it may be found that, as in the case of the stock market, most of the cheap merchandise had already been disposed of."

The buyer will have to size up the situation to meet the requirements of his own case and he should be in a position to analyze his own field. There is a very real situation in the opinion given above and purchasing agents and others should watch carefully to see that it does not work out and catch them rushing into a rising market, when all the time they had been waiting for it to come still lower.

# *Some Plants Have Not Lost an Hour Yet*

IT is quite wrong to suppose that factories in general are closed down in Canada. They are not. Neither is it right to imagine that they are all running short time in an effort to give as much work as possible to the staff.

From letters received by Canadian Machinery it is certain there are plants that have not yet lost an hour—some of them are working twenty-four hours a day.

There is no intent on the part of this paper to make it appear that everything is lovely, but there is a desire to allow information to come to the surface that will tend to show some of our blue-ruin shouters that industry in the Dominion is a long way from being headed for the bow-wows and that there are men who believe the bottom of the hill has been reached and that we are already starting on the way up again.

There is nothing more dangerous than insane optimism and nothing worse than unfounded pessimism. Between the two there must be the real situation—the one the people want to know about and ought to know about.

If you know of anything that looks to you like a hopeful sign either in your own business or in businesses with which you come in contact, let us hear about it. Give us the chance to pass it along. The circulation of business facts will make good reading now.

### Believes Orders Must Come Soon

A. T. Enlow, of the Dominion Sheet Metal Corporation, Hamilton, although not prepared to offer many things to boost the general situation, says: "There is a slight increase in the number of small orders being received and if this indicates anything we presume it means that the buyers are getting down to the boards and need the stock, but naturally are not buying very heavily until they feel sure that present prices are right. We never had all good conditions simultaneously, such as first-class quality, A1 service, lowest price and plenty of business, but the buyer must keep in mind that all the three other items cut little figure if he does not have good service and the wise man is the one who gets in at the right time."

### Finished Many Boilers

The Robb Engineering Works, Limited, Amherst, N.S., have been busy filling orders and right now are working on four Robert Manning type vertical boilers of 365 horsepower each for the Nashwaak Pulp & Paper Co., St. John, N.B. One of the Montreal schools had a good-sized order with them as well as the Montreal Harbor Commission. The Montreal Suspender & Umbrella Co. have also been purchasers of equipment from the Robb Co., while boilers have been shipped for installation in a number of new buildings that have been going up in Montreal and district.

### Here's a Busy Plant

The president of one well-known Ontario plant pays his respects to papers in general for publishing "absolute fiction, mechanically produced from the brains of well-educated editors, whom it would appear are paid by the word, to fill up white space." But after that preliminary canter this manufacturer gets down to business and makes it perfectly plain that things have been good with his plant. So far they have been able to keep their shop going and have not lost a minute and in one department that is working now with a view to building up an export business, they are going it twenty-four hours a day. He adds: "We notice a great improvement in inquiries. Particularly in the wholesale hardware trade stocks have been very low and as we guaranteed prices for a while that has stimulated buying."

Nor does this manufacture drop back on the old statement that collections are poor. Here is his view: "Collections are as good as usual, i.e., they are far better than they were before the war.. People seem to have cultivated the idea of paying cash and we have nothing to complain of in this direction."

### Not Impressed by Retailers

"We have not created any change in employment conditions," he continues, "so that there has been no complaint from the employees. We do not know just when wages will have to be brought down. Speaking generally, we do not think it is time to bring down wages on a flat scale, for the reason the workmen to-day is not benefiting by any supposed reduction in the cost of farm produce or in the cost of eats, for while the farmer and the manufacturer and the wholesaler have reduced their prices, the retail merchants have not decided to cut to the consumer yet. At least if they have it is not visible and many of the retail merchants, especially in wearing apparel, have become fakirs." The writer of this opinion then goes on to give the grounds for this statement, claiming that two Toronto stores had deliberately misrepresented the goods they were trying to sell.

This manufacturer holds strongly to the view that the price of material in the retail stores is a very real problem for the manufacturer at the present moment, for he cannot very well adjust wages until a reduction has definitely been made in the cost of living and passed on to the consumer.

### Better Conditions Ahead

A. M. Kerr, secretary-treasurer of the Preston Woodworking Machinery Corporation, states that their plant up to now has been working full time without any reduction in wages. Orders are being pretty well overtaken now and it is the intention of the company to make a small cut in wages shortly. Of conditions as their travelers find them, Mr. Kerr says:

"We have very little business on hand now, but our travelers seem to be successful in scaring up a few orders every week and they report conditions as being quite hopeful. It seems that there is business going, but it seems necessary to go after it with every possible atom of energy to successfully land an order. Our business is almost entirely derived from furniture factories, automobile factories and kindred lines. Furniture men report business as improving and they seem quite bright just now. Conditions in the automobile industry are looking better, too, and we confidently expect to be able to sell a goodly part of the output of our plant. We propose running along full force as long as possible, stocking up any surplus machines.

"We are getting better production per man in our plant than we did a year or so ago and this to our minds is the solution of the whole difficulty in our country to-day—more production per man, enabling us to lower prices and thus secure business which would then be offered."

### Just Sawing Wood

J. W. Shepperson, secretary-treasurer of Ham Brothers, Brantford, never could see blue ruin. Nor has he seen any reason to cross the floor in the present situation. "Would just add," he states, "that from some of the gloomy countenances one looks upon these days you would think this was actually the first period of depression the world had ever seen. Many a time in the past we have pulled through a far more depressing time than the present and we are of the opinion that if we just keep a stiff upper lip and keep on sawing wood it will not be long before we have the stick sawed through and no one will be very much the worse of the effort."

# MARKET DEVELOPMENTS

## Some Reductions Announced This Week

### Prices on Several Lines Have Moved Down From Ten to Twenty Per Cent.—Iron and Steel Prices Are Not Regarded as Being Very Firm and May be Marked Down

WHILE it is not possible to say that an era of lower prices has definitely set in on the iron, steel and machine tool market, it cannot be denied that the movement is in that direction. Especially is this so in machines turned out by the newer makers as some of the old-established companies are still working on orders and are in no mood to consider reductions. Many of the makers have planned their course very carefully and have avoided making up a large stock to urge lower prices on their sales force. Reductions during the week have been made in motors, gear cutting machines, internal grinding machines, etc., and these range from ten to twenty per cent.

Dealers are taking a more determined stand regarding cancellations and it is not an easy matter to get a cancellation accepted now. One firm cancelled the day the machine came, but the dealer fought it out in the courts and made acceptance necessary.

Some houses are reporting a much better week in inquiries than for some time past. None of these had been in the market before and they were from a widely distributed area.

Steel merchants are not taking in much material just now, still working on the theory that their best move for the present is to get their stocks down as low as possible. There is a fair amount of business going, but it is still in small quantities and for only immediate needs.

There is nothing better in the scrap metal markets. Dealers will hardly take on anything in iron and steel and only limited quantities of copper. Copper is looked upon as likely to improve before the other lines. Prices quoted are still very low and are not guaranteed.

Pittsburgh reports indicate that buyers generally anticipate some movement in steel there and predict that it will be downward in price. There are plenty of rumors of prices sagging several dollars a ton, but this has not become general enough yet to establish a new market at a figure below the price of the United States Steel Corporation.

## MONTREAL BUYING IS STILL DONE ON SMALLER SCALE THAN USUAL

Special to Canadian Machinery

MONTREAL, Feb. 17.—Despite the readiness on the part of buyers to take advantage of any discounts offered —which evidently shows a supply of available money for purchasing purposes —the acquisition of equipment is confined almost entirely to urgent requirements, and it is seldom reported that manufacturers are taking care of far future needs. The general tendency still appears to be that of deferring buying at present prices or while trading is in a state of depression. On every hand one sees and hears the note of optimism but seldom sees the instrument on which it is played. Some dealers are reporting slightly increased business, but only after strenuous efforts on the part of the salesmen. As one representative said: "Many seem to be willing but are evidently afraid."

**Further Revisions Possible**

Despite the recent announcements of different steel men that quotations were at rock bottom, there are indications that point to further revisions in existing prices, and that these will be downward goes without saying. Speaking of the week's activity, one dealer remarked: "We are not taking any steps to revise our prices, although this may become necessary in the next few weeks. Our business just now is not heavy but the movement is satisfactory. There is a possibility that mill prices in the States will be affected shortly, as some of the independents are quoting low in order to get business. Should this influence the big fellows to cut their present prices the result will be a general adjustment on the part of the dealers to meet the conditions of the new market. It may be that action on the part of the large interests would tend to place trading on a firmer basis, but there is this fact, the Steel Corporation has large orders still on the books, so they have no good reason to meet the lower prices."

**Looking For Better Business**

When one local machine tool maker remarked to Canadian Machinery that "business should show steady and increasing acceleration from now on," he only repeated what has been said by many during the past few weeks. This dealer admitted that up to the present no tangible reason could be given for the general optimism displayed other than the general need of all industry. "A great number of manufacturers," said the dealer, "have, during the past few years, practically starved themselves in the way of purchasing needed machinery and equipment. At present the buying is restricted owing to existing conditions of high costs and financial difficulties, a feature that is responsible very largely for the trade depression of the day. When the time comes when these obstacles will have been eliminated or reduced, the business will return in such force that we will have difficulty meeting the demand. This may seem like overdone optimism, but the trend undoubtedly is towards better business."

Asked as to the exchange situation, the dealer stated that the American tool manufacturer has been treating them fairly in the way of absorbing the high exchange, many of them leaving only that over 10 per cent. to be handed on to the buyer. Some of the principals had reduced the list price of the tools and when this had been done, the full exchange had been added. In some cases

ne change made little difference, as the educed list price plus exchange was qual to the former price with the exhange discounted. Movement of heavy ols is quite quiet and supplies and small quipment show little improvement.

### Metal Prices Firm

Metal movement is not heavy but is ill sufficient to retain the interest of the ade. Prices are quite firm and in some stances show a tendency to become onger. This is especially true of copers. Tin is gradually coming back to ormal, the price quotation this week eing 40 cents per pound.

### Old Metal Business Quiet

"We are looking forward to an early evival of activity and while any day nay see a movement to better business, e can only repeat what we have been aying for several weeks back, and that s, that present movement is just about enough to pay the overhead and keep the ffice open. However, we believe the tide s at its lowest and that soon we shall ee a gradual return to normal." This statement by an old material dealer differs little from what has been given for the past few months, and no concrete evidence is available to indicate a change for the better. Some local trading is carried on, chiefly with the grey iron foundry shops. Developments in the steel and iron market may influence the scrap situation to the extent of weaker quotations. The week's prices show no change and are nominal.

## MORE INQUIRIES IN LOCAL MARKET

**Several Changes Made in Prices—Steel Warehouses Getting Rid of Stock**

TORONTO.—Inquiries can hardly be looked upon as the state of trade, but in the machine tool field they are looked upon as indicating a desire on the part of people to buy. During the last week or so there has been an increase in the number of inquiries sent in from the Ontario field, which for some of the houses has been rather backward in showing much improvement. "We think most of the inquirers mean business," was the remark of one of the dealers this morning. "As far as we can learn none of them has been in before in the way of an inquiry. The list is pretty well scattered, and there are no very large orders, but it is a hopeful looking move."

Some of the machine tool dealers are having a little trouble with payments, and a few of them have cases of cancellation where their only way out is to fight. For instance, one dealer had a machine cancelled on him after it had reached the city, and he had notified the firm that he was clearing it and would commence the erection on the following day. In this case the dealer refused to cancel, and the acceptance followed in the usual way.

## POINTS IN WEEK'S MARKETING NOTES

**A number of makers of machine tools of various kinds, also of motors, have announced reductions in their selling prices reaching from 10 to 20 per cent.**

—

**New York reports that the machine tool market is still very dull there, and also adds that a quantity of German made equipment has been disposed of to one of the large industrial concerns.**

—

**The Pittsburgh steel market seems to incline to the belief that the Steel Corporation prices will be revised when it becomes more urgently necessary that they wish to secure new business.**

—

**The local steel merchants have not made any change in their selling prices although when a fair sized order seems liable to be placed there is often a departure from the recognized price.**

—

**Some of the machine tool dealers report that they are receiving many more inquiries than for some time past. These inquiries for the most part are from new sources that have not been in the market before.**

—

**Scrap metal dealers are buying only very small quantities of copper. They are not taking anything in the line of iron or steel. The prices are still away down and then the lower schedule quoted is only nominal.**

—

**A new base price has been announced for wire nails and also for cut nails.**

---

The tendency toward lower levels in the machine tool market is becoming more marked. On other pages of this week's issue of Machinery there are references to new prices on tools of several sorts. This paper has been notified by the makers of several lines that they are coming down 15 to 20 per cent. on the first of March.

### Selling in Small Lots

Mostly pick-up trade is what the average dealer in small tools would tell you were he to describe the situation now. There are a few good orders coming into the market. For instance, the National Railways have specifications out for about $5,000 worth of drills, mostly high speed, for the Moncton shops. This is the shop with which the dealers like to do business, as it has a reputation of being about the only one of the Government owned list to place orders promptly and make settlements in the same way. Prices have been fairly firm in the small tool business for some time, and shading of prices is not resorted to—at least if it is it is done in such a way that it does not get a chance to become gossip in the machine tool market.

### In the Steel Market

Dealers do not state that there have been any reductions made in prices yet, but it is a fact that there is a tendency to shade prices. This is always liable to happen when firms are out after business, and that is exactly what is happening now. Bar iron is still quoted at 4.75 base, but all the dealers know that there have been some exceptions to that price. The price is based on present mill prices, but the eagerness to secure any business that comes up blinks at these things now and then.

Boiler tubes are moving out a little better this week, although the season on the whole will be only a fair one for this line.

Some of the yards in this district are working hard to get rid of stocks, and prices are being placed pretty close to the limit in order to get in shape to take advantage of any better price schedules that may be brought out.

In some lines business is coming in better, but mostly in the small goods.

A new base price has been given for wire nails, the figure now standing at $5.10, while cut nails are quoted $5.75, f.o.b. Montreal. Copper rivets and burrs are also selling under a new list, dated February 7, showing quite a reduction.

### The Scrap Metal Market

Business dull, prices only nominal—that tells the story of the scrap metal market this week. Dealers will hardly go to the length of stating they are out of the market entirely, a position they were prepared to take a few weeks ago. The chances are that one would find it fairly difficult to place a tonnage of iron or steel, unless at a runaway price, but it is possible that some of the yards would be inclined to take on small lots of copper. The chances are that the price of that metal will be one of the first to show signs of recovery when the tide turns definitely.

## NEW PRICE STARTS ON FIRST OF MARCH

**Landis Announce New Price That Is Down from 15 to 20 per Cent.**

Canadian Machinery has received the following letter from T. H. King, sales manager of the Landis Tool Company:

"Beginning with March 1, 1921, it is the intention of Landis Tool Company to make a general reduction in prices on all machines with the exception of the crankshaft grinding machine. This reduction will average 15 to 20 per cent. on our entire product with the exception noted."

## SOME PRICES ARE ON THE WAY DOWN

**New York Market Is Quiet, Although a Number of Reductions Are Named**

Special to Canadian Machinery

NEW YORK, Feb. 17.—There have been price reductions during the past week or two on miscellaneous lines of metal working equipment.

The General Electric Company reduced motors about 10 per cent., and most of its competitors have followed suit.

Two makers of shapers reduced prices 15 per cent., following the same action by a Newark maker a few weeks ago.

A manufacturer of power presses in Brooklyn has reduced prices 10 to 15 per cent. and Rochester manufacturers of high-speed riveting hammers have reduced prices 10 per cent.

Other reductions include 15 per cent. by a maker of automatic gear cutting and riveting machines and 10 per cent. on oilstone grinders.

Business is very dull in most machine tool markets, though a slight improvement is noted here and there. The sentiment has improved in the automobile manufacturing section of the country, due to the speeding up of production at some of the plants.

The only large business in prospect which may be placed this week is a list required by the Santa Fe Railway, totalling about $150,000, and a list of tools to be bought by the Ohio Locomotive Crane Company, Bucyrus, Ohio, of a like amount.

A few German punches and shears were bought a week or so ago by the Ohio Locomotive Crane Company.

## PRICES REDUCED ON SEVERAL LINES

**Mills Are Out Looking for Business and Prices Are Starting to Sag**

Special to Canadian Machinery

PITTSBURGH, Feb. 17.—This week has shown the first definite breakaway from the Steel Corporation schedule. Many buyers have refused to regard that schedule as final and they are feeling now that their belief has ground in fact.

The Midvale Steel & Ordnance Co. has instructed its sales offices to find out the prices at which orders can be secured and also has granted authority to take the business. The drive on the part of this company has resulted in definite offers of tonnages of the major products at well below the regular market quotations. Since the instructions were not written it is difficult to obtain actual information as to the prices named, but it has been verified that it named 2.25c., Pittsburgh, on shapes and bars.

Unverified reports have been current of quotations of 2c on bars and it also is rumored that the same price was named against a tonnage of plates in the Chicago district.

Other independent interests have done nothing in the matter of price cuts, but it is patent that in the event any business is uncovered by the company which is active in this respect the others will go along.

So far as can be learned the effort to interest buyers in purchases at practically their own prices has not been successful. This, however, was to be expected, in view of the fact that the first effect of a sudden reduction in prices usually is to make buyers cautious. The Steel Corporation subsidiaries meanwhile are holding to the level of prices which it has observed now for almost two years, and apparently they are content to wait to see what success attends the efforts of independent companies to secure business at lower prices before taking any action either as regards selling prices or wages. It is pretty well established that the cutting of prices by independent companies is to be accompanied by lower wages, and since the rates of Pittsburgh and Youngstown companies have not yet been disturbed it is figured that the acceptance of business at the prices named would involve a cut in wages of as much as 30 per cent. The market is even duller than it has been as a result of the apparent willingness of independents to consider lower prices, and prices are even more indefinite now than they have been at any time since the reaction in business set in last fall.

The recession in the activities of the Steel Corporation subsidiaries has been rather pronounced in the past week. The Carnegie Steel Co. has one less active blast furnace than a week ago, and while it has all of its ingot making capacity on except its Sharon, Pa., works, production is not over 90 per cent. of capacity, and finishing mills are not as fully engaged as they were recently. With new business on a very light scale as compared with completed tonnages, it is probable that before the end of the month total operations now averaging close to 90 per cent. will be below 80 per cent. The company at an early date will shut down its Columbus, Ohio, works, due to the lessened demand for sheet bars from the American Sheet & Tin Plate Co., which as far as sheets are concerned is not nearly so busy as it was recently. The American Steel & Wire Co. has experienced no improvement in business and its plant operations still are declining. The National Tube Co. is the one subsidiary organization which continues to run full.

The increases in independent steel company operations are only partly sustained, for new orders have not been coming forward in volume sufficient to offset those which have been completed.

The pig iron market reflects no increase in interest on the part of melters, although one large company in the week under review bought about 2,000 tons of foundry iron for early delivery.

## Scrap Metal Market

The prices of scrap metal are steadie as the downward trend is halted in som districts. The demand continues ligh

Quotations in the Chicago district ar remaining steady. Scrap for foundr use is in demand as founders seek t average their high-priced pig iron. Rai roads are offering tonnages.

On the Boston market several sales o No. 1 machinery scrap have shown a improvement in price. One Massachu setts foundry bought four cars at $25.5 del. A sale was made of several car of stove plate at $15 del.

The steadiness of the scrap metal a New York is reported to be due more t lack of buying than any improvement i sentiment. There is very little inquir from consumers.

Heavy melting steel has weakened or the Buffalo market and is now quoted at $15 to $15.50, with little selling. There is no sign of a buying movement.

Pittsburgh reports that some railroad scrap is being purchased occasionally. The Pennsylvania railroads offerings in the territory aggregate around 18,000 to 20,000 tons. One iron works is said to be in the market for 1,000 tons of heavy melting steel, but is offering only $12 and dealers and brokers claim to be unable to buy at $15 to $16. Releases on old scrap contracts continue to be difficult to obtain.

The market at Cleveland is absolutely devoid of activity. Consumers are not buying, shipments are not being accepted by mills, and the market is such that exchanges between dealers have practically ceased.

The trend of the St. Louis market is downward, several reductions being made during the week. The new quotation in rerolling rails is now $15.50 to $16. Steel car axles dropped $1.50, now being quoted at $19 to $19.59, and wrought grades, knuckles, couplers, locomotive tires, springs and steel angle bars were reduced 50 cents each. Dealers who recently bought scrap are discouraged. An inquiry was made for 3,000 tons of rerollers from an Indiana interest.

Birmingham reports that trading in the southern scrap iron and steel market is insignificant. Little change is expected within the next 60 days. The larger dealers are adding to their stocks. Quotations are unchanged, though the market is weaker.

It was stated at the annual meeting of the International Railway Fuel Association at Chicago that the life of a boiler fired with coal is about 10 per cent. greater than one fired with oil, while the life of the tubes is about 40 per cent. higher in the coal burners. This statement is the result of experience gained on the Santa Fé system where one-half of the locomotives have been constructed or converted to burn oil.

# How to Get the Employees to Tell "Why"

## Plan Adopted at the Dodge Plant to Learn What the Men Thought of the Firm—Prizes For Telling Why They Stayed and What They Liked and Disliked

By HARRY BOTSFORD, Publicity Manager Dodge Mfg. Co.

PERHAPS the most difficult problem the man in charge of personnel work has to contend with is to get a definite worth-while expression from the employee of just what he thinks of the various forms of welfare work and of the organization that employs him. This was exactly the situation Doctor W. H. Moore, manager of industrial relations for the Dodge Manufacturing Company, of Mishawaka, Indiana, ran up against.

There were six questions which puzzled Doctor Moore and the six questions which puzzled him are questions that might well be asked in every organization, whether or not that organization is of sufficient size to warrant the employment of a highly trained personnel man.

The six questions which perplexed were: What is the Dodge spirit? Why do so many stay so long with Dodge? How can we get the old Dodge spirit into new men? How does an old Dodge man feel about the company? What are the impressions of a new man? And, how can we attract and hold the kind of a man who will stick?

Here were six vitally important questions—a knowledge of the answers would be of manifest advantage not only to the manager of industrial relations but to the entire organization.

At last the idea came to carry out a prize contest in the Dodge News, our weekly internal house organ. Announcement of the contest was very brief and the rules governing were made just as fair as possible. Any employee was eligible; one subject could be selected and the answer was not to contain in excess of 1,000 words. No names were to be signed to any paper but the name, department and clock number of each contestant was to be written on a separate sheet of paper, enclosed in an envelope and attached to the entry. Three prizes were offered: $25, $10 and $5.

The judges of the awards were the manager of industrial relations, the office manager, the superintendent of one of the shop departments, the manager of branch offices, the editor and assistant editor of the Dodge News and the writer. Each of the judges read all of the many papers turned in and selected the three he believed to be the best and wrote out his selection and placed it in a sealed envelope, each making his decision independently of all the other judges. This assured absolute fairness in judging.

When the judges' decisions were compared it was found that the first prize was awarded to a worker in the steel shop who had chosen to give the impressions of a new Dodge man. This man had been a "boomer" and an industrial drifter all of his life but had decided that he liked the organization so well that he was going to stick. To say that the ideas he advanced were valuable to the manager of industrial relations is to put the matter mildly. For an organization to have something in it which will make a solid citizen and a steady worker out of a "boomer" is one thing, but to know what brought about the metamorphosis is several things. For example, we found this man liked our commissary where we sell groceries and clothing to our employees at cost; he enjoyed the benefits of our relief association, he had saved money through our thrift club; he had particularly enjoyed the advantages of our employees' club, our cafeteria and the Dodge News. He was especially grateful for the treatment accorded him by his superiors and of the general spirit of good-fellowship and co-operation between all units of the organization.

The second prize went to one of the office men who told how we could attract the kind of men who will stick. The suggestions advanced were excellent and sensible in every sense. The manager of industrial relations secured many worthwhile ideas from this paper.

The third prize was from a member of the order department who has been with the organization for over twenty years. Naturally, this man selected as his subject why so many stay so long with Dodge. He treated his subject in rhyme but nevertheless it was a sane and sensible text which covered the entire subject.

We are now running in our internal house organ the papers of the winners and of those who secured an honorable mention. These papers are read by the employees each week with great interest.

The contest has been worth-while from every standpoint. We secured the opinions of the workers on some matters which have been bothering us for some time. The opinions, in every case, were more frank and open than they would have been otherwise. The use of the prizes has more than justified the small expenditure required to put the idea across.

What we have accomplished is possible for any other organization to do; we have found out what our workers think of us, our plants, our ideals, and welfare plans. We have secured several valuable hints and ideas which will eventually develop into some changes in our present welfare and personnel work.

We believe the contest idea is well worth the time and money spent. The number of entries were large and answers came from our branches from Seattle, Wash., to New York City, which has proven to us the interest the employees take in our organization.

## Pig Iron Markets

On the Pittsburgh market one company has closed for 2,000 tons of foundry iron for prompt delivery to its Pittsburgh district plants, the iron running in equal quantities from 1.75 to 2.25 silicon and 2.50 to 2.75 valle yfurnace, the former at $28 and the latter at $29.25.

Pig iron has shown further weakness on the Chicago market and southern foundry has dropped to $27.50 base Birmingham. The leading steel interest still has 22 furnaces in blast, but has reduced its steel making to about 80 per cent. capacity and is rolling finished material at 75 per cent. rate. One new blast furnace was blown in today.

The tendency of the New York market is downward. A Bridgeport melter purchased 1,000 tons of foundry and 500 tons of malleable, the price of the foundry iron is understood to have been less than $30 at furnace.

In Pittsburgh district one local house reports a sale of 750 tons No. 2 Pennsylvania foundry iron, to be delivered within three or four months, at a price around $30 furnace. One company is reported to have bought 1,200 tons silicon 1.75 to 2.25 Eastern at about $28 at furnace.

Improvement is shown on the Buffalo market both in inquiries and active orders. One producer reports orders for 5,500 tons being booked, also many inquiries. Car wheel manufacturers are said to be ready to come into the market and considerable business is expected to come from this source. Another sale was made of 800 tons at $30. No sales at less than $30 have been reported.

Severe dullness marks the St. Louis market. A few small sales have been made but no general market established.

A little activity in foundry iron is shown in the Cleveland district, and prices have settled down to $29 and $30 for No. 2 foundry.

An inquiry for 5,000 tons of basic iron has been received from a steel plant in the Cincinnati district and expectations are that part of the order will be placed.

While there have been reports of sales of foundry iron on the Philadelphia market at less than $30 furnace, these have not been confirmed. Only seven Eastern Pennsylvania furnaces are in blast with 26 out.

# The Week's Events in Montreal Industry

I. W. Drayton, buyer for the Canadian Fairbanks-Morse Company, in Montreal, has been on a business trip to the States for the past week or more, visiting Chicago and other American cities.

W. S. Worthington & Co., engineers and adjusters, 58 St. Francis Xavier St., Montreal, will remove to more commodious quarters in the old Sun Life Building at 142 Notre Dame St., about the first of March. This company is the sole representative for Canada of the Metals Cutting Company of Canada.

The Montreal General Tool Company, 29 Notre Dame St. East, Montreal, are desirous of getting in touch with firms in the larger centers, for the manufacture of the Victor Radiators for the heating of residences, factories and office buildings. These radiators require only about one-eighth the volume of water as that used in the ordinary radiator, for the same heating capacity.

The Dominion Engineering and Construction Company has been organized for the manufacture of "Delco" machines and "Viking" pumps. A plant has been established in Longueuil across the river from Montreal, and machinery is now being installed. It is expected that the factory will be in operation within a short time. A. G. Kidston & Co., 17 St. John St., have been appointed the Canadian selling agents.

The Grand Trunk Point St. Charles shops in Montreal will be closed during the present week, for the purpose of overhauling the power equipment, general transmission and air compressors. A complete inventory has been taken recently of every machine and piece of equipment, and also the buildings, for the information of the arbitration board now sitting in Montreal, in connection with the handing over of the road to the Dominion Government.

The Engineering & Sales Service Co. of Montreal are now well established in their new premises at 179 Duke St. In addition to their sales service the company are acquiring machinery and equipment for the carrying on of a general jobbing and repairing business. It is expected that the company will be manufacturing Promet here in Montreal in the course of a few weeks. For the past couple of years the Engineering Sales & Service Co. have been the sole Canadian distributers for this metal.

Roy M. Wolvin, president of the Dominion Steel Corporation, has returned from England, where he has been in conference with officials and others interested in the steel merger, but no immediate announcement will be made as to what has been decided regarding the early developments of the British Steel Corporation. Regarding the Dominion Steel Corporation's connection with the proposed merger the president remarked: "Matters have not yet reached a point where any definite statement affecting the affairs of the company can be made."

At the fourth annual meeting of the Montreal Branch of the Canadian Division of the Aerial League of the British Empire, which was held at the Ritz-Carlton Hotel, in Montreal, last week, the name was changed to the Aerial League of Montreal, owing to the disbanding of the parent league. A review of the past year's work, which included the establishment of the Montreal Air Harbor, were given by the Commodore, A. E. Tylee, and other officials of the league. Sir Arthur Currie was elected president for the coming year, and after the election of officers, he gave an interesting address, briefly outlining the objects of the league and the possibilities of the future.

# INDUSTRIAL NEWS

## NEW SHOPS, TENDERS AND CONTRACTS PERSONAL AND TRADE NOTES

## NEW ADDITION TO CHATHAM PLANT

**Chatham Malleable and Steel Manufacturing Co. Extend Their Premises**

An addition to the plant of the Chatham Malleable and Steel Manufacturing Company, Limited, manufacturers of automotive and hardware specialties and sanitary stable equipment at Chatham, Ontario, is now complete, and the necessary machinery is now being installed. The addition is a one-story, heavy timber frame building, 36 x 100 feet, constructed on a cement foundation, and with a cement floor. Its principal use will be for assembling room and stockroom, but some manufacturing processes will also be carried on in it. The estimated cost is in the neighborhood of $5,000. It will mean a material increase in output as lack of room has hitherto been something of a handicap.

The company report satisfactory conditions in their business. Their plant has been working on full time all winter and orders in hand and prospects seem to warrant the expectation that this will continue for the balance of the season.

## ECHO OF THE WAR DAYS COMES UP

**Hannevig Said To Owe Large Sum To Local Shipbuilding Concern**

According to an announcement from New York, Hannevig & Co., a banking, foreign exchange and shipping concern, which was interested in the Dominion Shipbuilding and Repairs Co., of Toronto, has gone into the hands of a receiver.

The appointment of a receiver followed the action of Osler Wade, assignee of the Dominion Shipbuilding and Repairs Co., in seeking to collect $887,105 which Christopher Hannevig is said to owe the defunct concern.

It was claimed that Hannevig has large assets and liabilities in Norway and a receivership is necessary to prevent the dissipation of the assets of Hannevig & Company.

The receiver issued a statement to the effect that the trouble which Hannevig & Co. found themselves in was due to the delay of the United States Shipping Board in adjusting its obligation with Hannevig & Co. Mr. Hannevig said his creditors would be paid in full as soon as the settlement was made.

## READY TO FIGHT THE CANCELLATION

**What One Toronto Dealer Has to Say in Regard to This Abused Practice**

THE business of cancelling orders after they have been placed and finished by the makers is a hard one to deal with. That, at least, is the conclusion of one Toronto dealer.

Referring to the practice which has become such a common one in many circles in this country he stated that only a short time ago he had a cancellation sent to him and decided that the proper thing would be to fight the matter in the courts and find out if there were anything binding to a firm's signature on the strength of which he had gone ahead and undertaken serious obligations.

"The machine was from five to six thousand, and the order was taken some time ago. Only a short time ago one of the members of the firm was in the office, and I mentioned that the machine was here and we were clearing it. Erection in his plant would be undertaken in a day or so.

"The next thing that happened was the receipt by us of a hurry-up letter of cancellation. Business was not as good now as when the order was placed, but later on the machine would be needed. The idea was that we were to be made part of the getting-out system. There was nothing left for us to do but stand pat, and go to court, with the idea of finding out exactly where we stood. The result was that delivery was made.

"A dealer must protect himself in some way, and it seems to me that such a matter is only one of many that an organization of machine tool dealers could deal with. Why could they not frame up certain standards of practice, which would include decent methods of doing business, and have a uniform attitude toward the cancellation business. It seems to me that we must attempt to work toward the idea that a contract is a contract—that it is a moral obligation, signed, sealed and delivered, and backed up by the firm's name. If we cannot depend on such a document, then what is there we can depend upon?"

T. J. McFADDEN.

T. J. McFadden has joined the Western Ontario sales staff of the Diamond Stake Fibre Co. of Canada, with headquarters in Toronto. Mr. McFadden has had both executive and factory experience with the company before joining the sales force.

## HAS FAITH IN THE ELECTRIC ROADS

**Railway Engineer Quotes Figures That Show Where Savings Would Be Made**

London.—The superior financial and operating advantages, together with the coal problem, will eventually compel the electrification of all Canadian railways, D. M. Morrison, chief engineer of the London & Port Stanley Railway, told the Rotary Club. Mr. Morrison declared that the electric locomotive is capable of working 24 hours a day seven days a week; that an electric railway can haul a third more freight than a steam road on this continent, and that maintenance of way charges are 50 per cent. less when electric locomotives are used. He stated that if all the steam roads in the United States were electrified the saving in coal annually would amount to 122,500,000 tons.

A factory building has been leased by Eckensweil and Harkley, Walkerton, Ont. After being remodelled and equipped it will be used for the manufacture of cement tile.

# HIS PREDICTION OF WHAT IS LIKELY TO HAPPEN DURING 1921

WHEN the average man speaks of business conditions to-day he prefers to take a chance on the long future rather than on the immediate present. It is not committing one's self to any particular course to say that ultimately things will be all right, and that conditions are fundamentally sound, or something of that sort.

But Arthur S. Dewing, of the Department of Economics, Harvard University, goes one better than that. He takes the year as it is coming to him, and forecasts the high spots. It was in 1916 that he wrote a post-war prediction for the Yale Review, and what he had to say then came true in so many ways that what he has to say of 1921 carries some weight. Here are his views summarized:

(1) Buying public will continue to demand reduction in prices on commodities above pre-war prices.

(2) Retail merchants will buy sparingly by reason of high interest rates and feeling of uncertainty regarding their customers' attitude.

(3) European countries will not increase their purchases beyond barest necessities and will make strenuous efforts to increase their exports.

(4) The forces that have brought about decline in prices and wages will continue to operate and general course of commodity prices will be toward lower basis.

(5) Certain basic materials like copper, tin, cotton, hides and rubber will not decline much below present values and copper will be the first to feel the effects of better conditions.

(6) Basic commodities like steel, lumber, hogs and cereals will go lower and pig iron will reach its lowest level by midsummer, but fabricated steel products will probably continue to decline throughout the year.

(7) Retail prices of goods produced from these basic commodities may be expected to continue to fall throughout the year. Copper, cotton, and woollen manufactured articles, for example, may very probably sell to the consumer for higher prices by next winter owing to the exhaustion of the stocks of the raw material, but the general reduction in the retail merchant's overhead expenses coupled with the keenest kind of competition among retailers may keep down even these prices.

(8) Interest rates, profits and wages are destined to fall steadily during the year. That wages and profits decline during a period of falling prices is merely the converse of the proposition that they rise during rising prices—and the truth of this is all too clearly before us from the experience of the last few years.

# CAN UNDERSTAND FROM PICTURES

**Canadian Machinery a Welcome Visitor at the Trade Commissioner's Office**

Wendell McL. Clarke, Trade Commissioner to Italy, will be leaving for that country again in a few weeks, having been in the Dominion for the past two months. Mr. Clarke believes there is good business to be done there and intimates that reports of industrial conditions, strikes, etc., were very much exaggerated.

"Canadian Machinery," he remarked, "is of great assistance, and although it is printed in English, the illustrations in the reading matter and in the advertising pages enable the people to see just what many lines look like. Many of the Italian people are surprised that such papers are turned out in Canada. They are of great assistance in furthering Canadian trade in foreign lands."

---

A refinery will be built by the Royal East Duke Oil Co., 171 St. James St., Montreal.

# Trade Gossip

**Captain Fatally Injured.** — Captain Kenneth McKenzie, of Tiverton, was fatally injured at his home in Tiverton, nine miles from Kincardine. He went down into his cellar to look at the acetylene plant, which had not been working properly the night before, and it is surmised that he lit a match, for there was a heavy explosion, and part of a match was found on the floor. He was found with his skull crushed in and both arms broken. He died as he was being carried upstairs.

**Make Disc Wheels.**—The National Engineering Company, Limited, of Sarnia, Ontario, who manufacture air compressors, automobile tire pumps and machine tools of various types, intend to add disc wheels to their list of products in the near future. The National Engineering Company are one of Sarnia's newer industries. Their plant has been in operation since April, 1920, and at present from twelve to fifteen men are employed. The company's capitalization is $150,000 and the officers are: J. W. Lawrence, president and general manager; W. A. Swan, vice-president and factory manager; and J. E. B. Phelps, secretary-treasurer.

**The Blashill Wire Machinery Co.,** Montreal, is looking for a local site to establish a plant for making wire fencing. A new type of fence making machine has been designed by A. E. Blashill and the company have been planning the establishing of a plant for two years, but owing to the difficulty of securing raw material the plans were for the time abandoned.

**Must Quit Union.**—Twenty-two electricians, mostly outside linemen, employed by the Winnipeg City Light and Power Department, were suspended and paid off for failure to comply with the order of J. G. Glassco, manager, that they sever their connection with the Electricians' union. The men, it is understood, will be given a day or so to comply with this order, failing which they will be permanently dismissed.

**Sold the Plant.**—Canadian Car and Foundry Company has recently disposed of its Rhodes Curry plant at Amherst, N.S. The plant was not in any degree a vital part of the Car Company's organization and its disposal will enable the Car Company to enter 1921 in a stronger liquid position than otherwise would have been the case. The remaining plants of the company are capable of caring for the unusually large volume of orders now booked.

**Build $30,000,000 Bridge.**—At a meeting of upward of 200 officers of the R. T. Scott Co., Ltd., at the Prince George in Toronto, announcement was made that this Toronto house has secured the financial contract to raise the $30,000,000 required for construction of the Detroit-Windsor bridge, the bond issue being in $30,000,000 seven per cent. preferreds and an equal amount of common bearing eight per cent. Three years is the selling period. Announcement was made of the opening of ten new branches, two of them here.

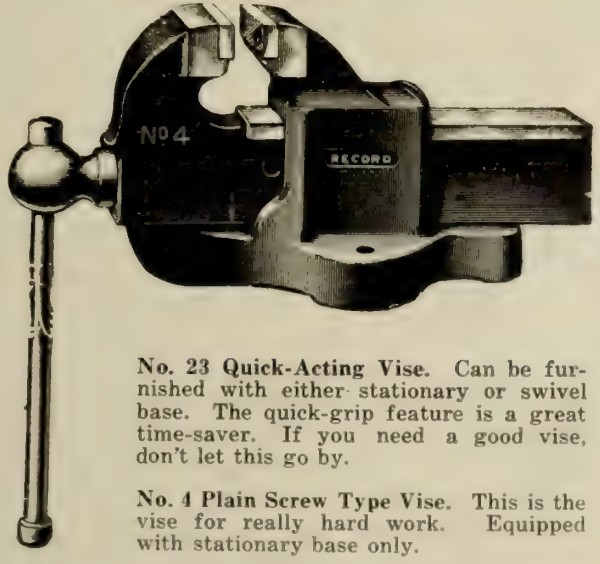
**Will Pay Dividend.** — Contrary to somewhat generally held expectations, no statement was given out at the conclusion of the meeting of the board of directors of the Dominion Steel Corporation, held in Montreal. It is understood that the chief business considered was composed of details in connection with the amended plan to merge the two steel companies, the Dominion and Scotia, with the possible inclusion of the Halifax Shipyards, Limited, and the Maritime Nail Company, of St. John. The one development of public interest was the announcement that the directors had declared the usual quarterly dividend of 1½ per cent. on Dominion Steel Corporation common stock payable April first to shareholders of record March fifth next. The regular 1¾ per cent. disbursement on the preferred stock of the Dominion Iron and Steel Company was also declared, payable April first to record March 15th next.

Aikenhead's

## Canada's Leading Tool Supply House

When you want tools, think of Aikenhead's. Let us make good our boast that we can supply you with "Anything in Tools" **promptly!**

# The Wahlstrom Drill Chuck



### *Keyless and Colletless. Never Slips*

With a Wahlstrom your operator can drill any number of holes of different diameter one after the other simply by grasping the chuck with on hand and replacing the loosened drill with another—**and two seconds does it.**. It is not even necessary to stop the spindle.

This Wahlstrom Automatic self-centres the tool perfectly and its instant-acting jaws close on the entire shank in a grip that becomes firmer as the resistance to the tool increases. The clutch can't slip and the jaws never mark a tool.

Made in two styles. One holds Nos. 1, 2 or 3 Morse Taper Shank Tools—with or without tang. The other is made in three sizes: 15-64 in. to ½ in.; ⅜ in. to ¾ in., and 17-32 in. to 1 in., thus holding all sizes of straight shank tools from 15-64 in. to 1 in. Booklet upon request.

**No. 23 Quick-Acting Vise.** Can be furnished with either stationary or swivel base. The quick-grip feature is a great time-saver. If you need a good vise, don't let this go by.

**No. 4 Plain Screw Type Vise.** This is the vise for really hard work. Equipped with stationary base only.

# "Record"

## Mechanics' Vises

"Record" Mechanics' Vises are strong, reliable tools which can be depended upon to stand the rough abuse which is the usual lot of a vise. They are made of the best grey iron castings. This is your opportunity to secure a high grade English Vise at a remarkably low price. Ask for fuller description and price list.

## Aikenhead Hardware, Limited

**17 Temperance Street, Toronto, Ont.**

### CLEANING SCRAP METALS FOR CASTING

Scrap metals vary considerably in accordance with the source from which they are obtained, and this way they may be melted and cast direct or have to be made into ingots and re-melted as the case may be; but in all cases where level color is required, as with brass, either very careful sorting or melting in large quantities and casting into ingots becomes necessary, a large natural draught air furnace usually being selected for this class of work.

The scrap from factories, continues Practical Engineer, is usually fairly regular in character, but that collected from miscellaneous sources is generally very uncertain and has to be carefully sorted and graded. With non-ferrous metals and alloys it is an essential that all iron be picked out, and in fact all of these should be massed through a magnetic separator of some kind. Painted metals usually hold oxides of metal in the paint, which are reducible should they get into a bath of molten metal, and even when not reducible the paint base is likely to cause unsound metal unless removed. Zinc-coated iron should never be melted for making castings, and painted iron will at times cause trouble because the paint stock is not always quite destroyed or reduced in the furnace. Having as far as is possible cleaned and sorted the metal before melting, it becomes of some importance to clean it after melting, and here it is desirable to skim crucibles as soon as the metal melts, thus removing not only dirt but nickel and the like with which the scrap may have been plated. To remove the oxides which may have become entangled with the molten metals, with aluminum and its alloys a flux of zinc chloride, with cupreous alloys a flux of salammoniac, and with iron either fluorspar, soda ash or ferro-aluminum should be used in quantities as may be needed, unless some proprietary flux is preferred, and some of these things are very good indeed if used as the makers advise. Scrap does not answer for castings which have to stand tests, but for a large amount of work it is useful on account of its low price as compared with new metals.

---

**Business Better.**—Reports received by the directors of Ontario Steel Products Limited at a recent meeting showed that business was looking up. More orders were coming in, and business appeared to be looking brighter in every way. The plants at Chatham and Gananoque are said to be running at considerably more than half capacity, and there does not seem to be any reason to expect any change in the dividend policy.

**Russian Business.** — An undertaking for the repair of virtually all of Russia's locomotives, extending over a number of years, has been signed between the London firm of Armstrong, Whitworth and Company and the Russian Trade Delegation. Reports to this effect had been current for several days and the company has confirmed them. It announces that the contract is subject to the signing by Great Britain of the trade agreement with Russia.

N. L. Somers, assistant works engineer for the past four years with the Algoma Steel Corporation, is incorporating a company, with head office in Toronto, to engage in sales engineering and contracting. Power development and transmission supplies and equipment will be specialized in.

---

## OBITUARY

The death occurred at Hamilton on January 27 of Robert McMurtrie, who for many years was a salesman for the Steel Company of Canada.

The death occurred at Toronto General Hospital on February 6, after a short illness, of Mr. James G. Cane, one of the city's leading lumber merchants. Mr. Cane had been in the lumber business in the city for thirty years as head of the firm of J. G. Cane & Company.

The death occurred at Goderich on January 31 of Capt. Alexander Lawson, one of the old-timers of the Great Lakes. He was a master of sailing vessels and has owned several. He was one of the original stockholders in Hutchinson's Flour Mill, now the Western Canada Flour Mills Company. Some years ago he promoted the building of the Masonic Temple on West Street, Goderich.

# E. P. THOMAS REVIEWS WORLD CONDITIONS IN THE STEEL TRADE

E. P. Thomas, president of the United States Steel Products Company, the subsidiary of the United States Steel Corporation dealing with export business, spent a few hours in Toronto, during which a number of men interested in the iron and steel industry had the opportunity of meeting him at a luncheon arranged at the Toronto Club.

Discussing world conditions, Mr. Thomas had the experience of a long trip in Europe to draw from. "Many undertakings will be gone on with now that had been held up for years, fearing the outbreak of the German army and possible German domination. There is the railway in Mesopotamia to Bagdad, and other undertakings. During the years of the war a large amount of steel was withdrawn from commercial and industrial usage, and it is safe to say that now there is a shortage of fifty million tons of steel."

Neither Germany nor France nor Belgium was in a position yet to produce to anything like capacity. It would take France some time to take full advantage of her new iron ore and coal resources. Britain was having difficulty also with labor troubles, and there would be a big export business from the American continent.

The company of which he was head had such faith in the possibilities of the export business that they had gone ahead with the construction of 32 ten to twelve thousand ton ships, at a cost of from fifty to sixty million dollars.

Coming to the operations of the corporation at the plant at Ojibway, Mr. Thomas intimated that construction costs had been the chief obstacle in holding back the completion of this installation. They had already spent four million dollars there, but had hesitated in going ahead faster because the original estimate of twenty millions for the plant had come to look more like fifty millions. They were anxious as soon as possible to get under way in Canada, and to take their place as manufacturers in the Dominion.

For the long future Mr. Thomas had no fears, although for the immediate present he admitted that one man's guess was as good as another's. During his short stay in Canada he claimed he had unearthed even a better brand of optimism than was prevalent in many parts of the United States. Many of the problems following the war had been dealt with, and conditions were favorable to a resumption of normal business.

## TRADE GOSSIP

Several prominent Masons of St. Thomas, Ont., are advocating the erection of a large Masonic temple there.

An addition to their present warehouse is being planned by the Waterloo Manufacturing Company, Saskatoon, Sask.

Joseph S. Johnson died at his home in Galt on February 13. He was an engineer with the G.T.R. for forty-five years.

It was strongly recommended at the annual meeting of the Lambton Farmers' Co-operative Association at Petrolia, Ont., that an elevator be built at that point.

A permit has been issued to the Barrett Company for two tar storage tanks of concrete construction at the southeast corner of Keating and Saulter Streets, Toronto, at a cost of $20,000.

After a few weeks' illness at his home in Owen Sound, the death occurred of James McLauchlan. Mr. McLauchlan, who has been a resident of Owen Sound since 1871, was founder of the business now carried on by the McLauchlan & Sons, Ltd.

It has been stated by W. H. Shaw, head of the Shaw Business College, that he will likely erect a school building on property which he has purchased at 56 Wellesley Street. He is considering the erection of a building three or four stories in height, with all modern improvements.

**New Company.** — Incorporation has been granted to the Canadian Production Tool Company, Walkerville, for the manufacture of production tools, etc. H. E. Walker is president of the new company and H. N. Reynolds secretary-treasurer.

A plant will be erected by the M. N. and R. Fishing Company, in the near future, at or close to Prince Rupert, B.C.

The Ford Motor Company has reopened its plant at Highland Park, and is producing at 25 per cent. of capacity. The plant will operate on a three-day-a-week schedule at the outset.

The death occurred in Hamilton on January 9 of Miles O'Reilly Duff, who was, until the beginning of his illness a year ago, associated with the Dominion Bridge Works Company, of Toronto and Montreal, and also the Hamilton Bridge Works Company. He was a graduate in science of the University of Toronto, and a member of the Engineers' Institute of Canada.

## PRICES AND WAGES GO HAND IN HAND

**What Some of the Independent Producers Are Doing in Youngstown District**

Youngstown, O.—Independent producers of steel in this district are breaking away from the United States Steel Corporation's prices under the lead of interests east and west. Cuts in quota-

RATES FOR CLASSIFIED ADVERTISING

Rates (payable in advance): Two cents per word. Count five words when box number is required. Each figure counts as one word. Minimum order $1.00. Display rates on application.

tions ranging to $7 a ton for galvanized are heard. The range through seems to be from $4 to $5 a ton. Some interests will decline to name prices that will cause a greater loss than suspension of operations.

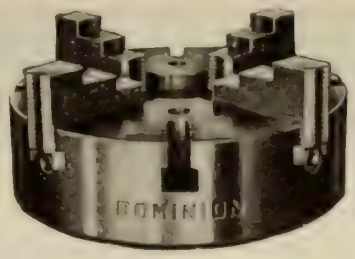
A substantial cut in wages by independents in those districts that are still adhering to the quotations in effect by the United States Steel Corporation is at hand.

New independent steel prices heard are 2.40c to 2.45c base for plates, 2.25c base for bars, 4.25c base for black sheets and 5.25c to 5.50c for galvanized, as low as 2.15c on bars and 5.40c on galvanized is heard.

## Personals

J. A. Evans has accepted the position as office manager with the Canadian Hart Products, Ltd., Hamilton, Canada. For several years past Mr. Evans has been with the Victor Saw Works at Hamilton.

James McGill, engineer on the Steamer Mallon, of the Matthews Steamship Company, whose home is at 44 Smith Street, Toronto, died at Cornwall on January 31, from injuries receiving by falling into an open hatchway on the vessel.



**Ready to Start.**—The plant of the Carbon & Alloy Steel Company at Fraser, Ont., is nearing completion and, it is expected, will be in operation by March 1.

**New Sales Office.**—The city sales office and show room of the Dodge Mfg. Co., Ltd., is being removed to the new Aladdin building, corner Simcoe and King Sts. They will occupy the entire ground floor.

**Getting Canadian Plate.**—What is stated to be the first shipment of steel plates of appreciable width from the Maritime Provinces to the Toronto district has arrived in Toronto. The shipment consisted of three carloads of steel plates, eighty-five inches wide, manufactured by the Dominion Iron & Steel Corporation, of Sydney, Nova Scotia, and transhipped via the Canadian National Railways to the Toronto Iron Works. Hitherto local firms have been obliged to order steel plates of this size from the big mills in the United States, and the fact that Nova Scotia has attained such magnitude as a steel producer is regarded as encouraging by the Canadian trade.

It is expected that excavations will be begun and foundations laid in Queen's Park, Toronto, early next spring for the new Trinity College. The latest estimates place the cost of the first stage of construction at half a million dollars.

The Machinery & Foundries, Limited, Brockville, which was recently incorporated to manufacture hand and power pumps, and gray iron and brass castings, will be in operation early this month.

## MACHINE WORK WANTED

MACHINE WORK WANTED FOR LATHES, shapers, milling machine and planer, etc. Hourly or contract basis. Prompt delivery. W. H. Sumbling Machinery Co., Toronto. (ctfm)

## AGENCIES WANTED

SOLE AGENCIES WANTED BY WELL-known, reputable and established English engineering firm, represented all over the world, for Contractors' or Municipalities' small Engineering equipment, which must be first-class, competitive in price, and in constant large demand. British made and patented preferred; if Colonial or Foreign, privilege or manufacturing in England required. Big sales assured for the right Equipment. Write giving details to "Engineering," P.O. Box 1934, Montreal. (c8m)

## POSITIONS WANTED

DRAUGHTSMAN (PERTH COUNTY) DESIRES change. Have had general experience of ten years. Am first-class practical shop mechanic, age 30. Married. If you are in need of a young man of ability, who has risen by merit only, let us arrange an interview. Address Box 747, Canadian Machinery. (c6m)

## HELP WANTED

WANTED AS ASSISTANT EDITOR, ON group of technical papers, live-wire mechanical engineer. Qualifications required are: Age, under 45; good education; certain amount of practical experience; ability to express ideas on paper; good mixer and aggressive worker. Splendid opportunity for the right man. State full particulars in first letter, mentioning present salary. Box 152, Canadian Machinery.

### FOR SALE

Enclosed liquid fuel combustion apparatus capable of generating intense heat in pipes and confined passages for heating parts of internal combustion engines and for other uses; spark ignited; blower operated. Patented April 3, 1917. Can be inspected at and for sale by H. W. Petrie, Limited, Toronto.

## What can we do for YOU?

Through these columns thousands of dollars of equipment are disposed of each year. If you are not using Canadian Machinery now, let us tell you what others have done—are doing.

*"A voice roared out, hoarse, profane;--the Mate's voice: 'Thought you'd try it again, did you, you dashed beach-comber. I'll teach you, and when I find the dog that left that rope for you I'll give him a leaf out of the same book. You bloody waster! I'll teach you! I'll—!'"*

This is an extract from Frank Packard's "Pawned," which commences in the February 15th issue of MACLEAN'S MAGAZINE.

At the period in the story that this is written the leading character is a beach-comber in the South Sea Islands.

Three months later, John Bruce is stretched at full length on a luxurious divan in the most sumptuous apartment of the Bayne-Miloy, New York's newest and most pretentious hostelry.

*How had this wonderful metamorphosis been made? It is a mystifying, enthralling, intriguing story, the secret of which you can only get by reading every instalment of Frank Packard's wonderful yarn.*

## OTHER UNUSUAL FEATURES

**"Are We Ashamed of Our Snow? No!"**
*By Charles Christopher Jenkins.*
This tells the story of the conquering of the snow-drift problems by the railways of Canada.

**"The Drama of Our Great Forests"**
*By Arthur Heming.*
"Meeting of the Wild Men," filled to the brim and overflowing with forest-lore.

**"Solons of the 80's"**
*By Col. Geo. H. Ham.*
Some episodes of the 80's and 90's when he and his confreres were recording Canada's political history.

**"Soldiers' Settlements Making Good"**
*By Agnes C. Laut.*
The wonderful success which has met the work of the Soldiers' Settlement Board in the West.

**"The Cross in the Sky"**
*By R. T. M. Scott.*
A psychic story; simply, forcefully told, and tinged with war atmosphere.

**"The Queer Toff in Number 13"**
*By Leslie Gordon Barnard.*
A human story of a brilliant man who almost "pegged out" until a wonderful love drew him back.

**"The City of Peril"**
*By Arthur Stringer.*
The concluding instalment of this melodramatic serial by one of Canada's favorite authors.

# *Good Times Just Ahead*

PROSPERITY is within our reach in Canada.

All we need to have and to hold it is a sane, sure grasp on its simple elements.

They are Industry, Integrity, and Faith.

These are the cardinal virtues of human relations. They are the underpinnings of healthy, natural business life and the foundation of a wholesome social system.

They are the fountainhead from which Progress springs. A well-known business economist has called them the "Fundamentals of Prosperity."

Your purchases are an expression of Faith. They are evidence of your Industry. Make them confidently from business institutions of Integrity.

Buying is the backbone of prosperity. An active market means more employment, steadier earnings; benefits are passed around.

Wise spending gives stability to earning and for that reason is far-sighted thrift and sound economy.

The call of to-day is for cheerful thinking, willing working and constructive action by you—everybody—NOW.

To-morrow's change for the better will come about through the combined efforts of each and every one of us.

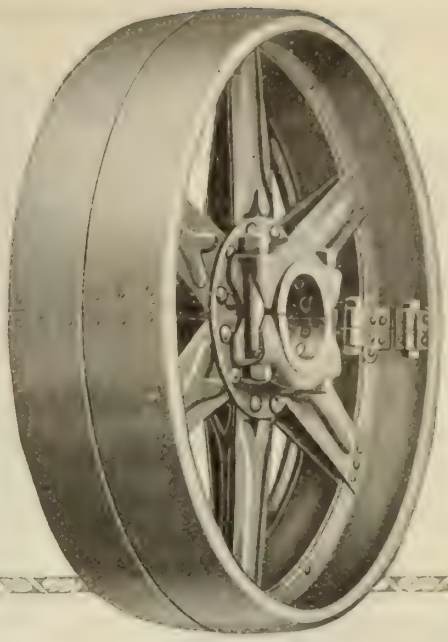
By sheer force of numbers and co-operation, by the high power of heart and mind, we can put Business on a firm, stable basis.

We can do this because all of the material factors making for better business are right.

Let us link our faith with industry, our vision with courage, and forge ahead.

Let's make an uncommon effort toward a common end—Good Times.

***A message from the Associated Advertising Clubs of the World.***



## STRENGTH

Strength is a very essential quality in a wrench, but it does not depend entirely upon bulk or weight of metal. The strength and long-lasting qualities of Armstrong Wrenches are the result of skilled combination of the Best Steel, Expert Design, Accurate Machining, and Heat Treatment. All kinds and sizes.

*Write for free Catalogue.*

**Armstrong Bros. Tool Co.**
"The Tool Holder People"
335 N. Francisco Ave., Chicago, U.S.A.

## *The Largest Plant Devoted Exclusively to Making Steel Pulleys*

THIS position, held by the American Pulley Company, could not have been reached had it not determined the correct principles of pulley construction.

For 25 years the features of various types of pulleys have been studied, compared and tested. No detail has been too small to investigate, and it is significant that, though there has been refinement, the basic principles remain the same.

But even such painstaking attention to construction would not have brought the "American" Pulley to its present position had not equal effort been placed on conscientious business management and fair dealing.

"Getting Maximum Pulley Efficiency" describes "American" Pulley features in detail. Write for your copy.

**The American Pulley Company**
**Philadelphia, Pa.**

The AMERICAN PULLEY

A wheel with a broad rim transmitting power from or imparting power to machinery—or changing the direction of power by means of a flat belt.

## New Air-Tight Blast Gates

will help you maintain the safety, economy and efficiency so essential in the operation of furnaces and other appliances using low or moderate pressure air.

**THEY ARE SAFE**— because they are ruggedly built of only a few simple parts; the blade stays fixed in any position and by a slight pull of the handle is easily adjusted to give the blast desired.

**THEY ARE ECONOMICAL**—because the initial cost is small; the simple construction eliminates wear and tear.

**THEY ARE EFFICIENT**—because careful machining makes them AIR-TIGHT; they afford the full area of the blast pipe, in striking contrast to a stop cock; they are quick in operation; they can be placed in any position.

***In short, these New Air-Tight Blast Gates possess all the advantages of stop cocks and valves, and have special features that tend for greater usefulness and economy.***

# tools for Your Plant

Thor

## PORTABLE ELECTRIC DRILLS

Drills unequalled for power at their weight; motors, hand wound, triply insulated, all encased in light aluminum. The result is drilling power when needed, right from the nearest electric light socket. Many plants using air tools have a number of sturdy electrics to handle the special jobs away from the air line. Others have standardized in speeding up production with THOR electrics.

THOR Electric Tools include 8 sizes of Portable Drills, with drilling capacity in steel, ranging from ¼″ to 2″; and a Portable Grinder with 4″ wheel. Get three or four THORS for demonstration on your work. Until you are convinced of THOR quality, you are not obligated.

The THOR line also includes a complete list of Portable Pneumatic Tools.

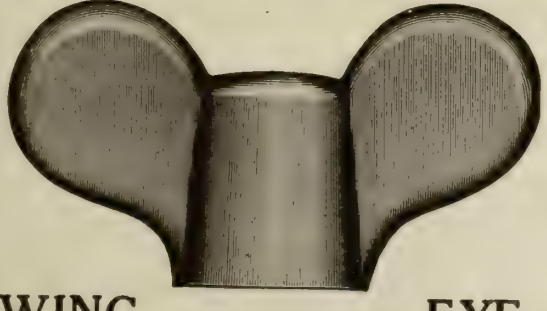
# Like Mahomet and the Mountain

It was lots easier to bring Prest-O-Lite and the oxy-acetylene flame to this mammoth wheel than to haul the wheel five miles from a mountain mine to a repair shop.

That's one of the advantages of Prest-O-Lite. Its ready portability makes oxy-acetylene welding possible and remarkably economical anywhere and everywhere.

And a chain of plants and warehouses assure a constant supply of Prest-O-Lite, the Universal Gas with the Universal Service.



All of which means a Nation-Wide Service which you will be interested in knowing all about.

# Boyers cost least *per rivet driven!*

THE cost per *rivet driven* is the true gauge of riveting hammer efficiency. No riveting hammer built has ever equalled the performance of the Boyer measured on the basis of *work done per hammer.*

Here are eight reasons why:

1 The Boyer patented hollow cylindrical valve, made of highest-grade steel, accurately hardened and ground to insure long life, air economy and freedom from breakage. Piston in action passes through the valve and is cushioned on its return stroke. Result—rapid, hard-hitting blows due to long-stroke and large air ports; shortened over-all length, minimized vibration and strain on operator. Boyer valves—*the valve with five lives*—are made in four over-sizes, resulting in constant air economy, sustained driving power, uncommon durability and low upkeep expense.

2 Special steel cylinder which, in production, passes through *sixty-five* distinct operations and processes, each performed by most modern equipment, with exacting care to provide proper machining, heat treating and finishing. Result—long wear without waste of air.

3 Boyer patented handle accurately formed to fit-the-grip, from high-grade specially heat-treated steel, insuring unusual strength. Handle, when gripped, places operator's arm in direct alignment with all reciprocating parts. Result—a riveting hammer that works *with* the operator, constantly encouraging more and better work.

4 Patented locking ring surrounding cylinder. Makes possible the unique method of assembly characteristic of the Boyer—and one reason why the three unit parts of the Boyer can be so rapidly disassembled for cleaning and inspection.

5 Patented exhaust deflector, instantly adjustable to any radial position. Protects operator's clothing, boosts his morale and keeps him "fit" for continuous efficiency.

6 Trigger control conforming to operator's natural grip. Embodies but two major parts, works smoothly and with a minimum of manual effort.

7 Valve stem heat treated to resist wear. Operates in replaceable steel bushing.

8 Boyer patented spring-clip set-retainer holds the set in place in the cylinder without restricting the free longitudinal movement of the set when in operation.

There is only *one* Boyer. Prompt delivery from Branch stocks. Ask for Bulletin 600.

# The Diamo-Carbo Dresser

This Dresser consists of a steel tube filled with an abrasive of such intense hardness that it will cut and dress any grinding wheel except the "hard" grade or the extremely coarse and large wheels used for grinding castings. The abrasive wears away slowly and, on the usual run of tool grinding wheels, lasts indefinitely. The Diamo-Carbo is now accepted as a satisfactory and economical substitute for the expensive black diamond and has been in use in the foremost shops in the world for the past ten years.

**Write for catalog of our various types of dressers.**

# *Examine the Grain!*

A properly alloyed babbitt has a perfectly uniform grain.

Break a bar of the babbitt you are using--

If you find the grain irregular—if it shows a mixture of fine and coarse particles—if it shows a separation of layers—one dark and one light in color--

then you may know that it is poorly alloyed—and that you can get far better wear from

*Lionroyal*

produced by the STANLEY PROCESS of alloying.

Lionroyal is clean—uniform—dense grained—and durable.

It is copper-hardened and tin-toughened. Bearings lined with it carry the load evenly—every inch of bearing surface equally durable.

It has no hard spots of copper or antimony, because the hard elements are thoroughly and uniformly amalgamated with the tough elements. This fact bespeaks steady service and long wear.

***Write for booklet "AB" to know more about pouring and using Babbitt.***

## Over seven pages printed here each week for your convenience

Consult this Buyers' Directory when you want the names of reliable makers of machine tools, parts, steel, in fact any equipment you may need.

THE

TRADE K—T MARK

FOUNDRY

GALT, ONT.

# Do Your Castings Cost Too Much?

A rearrangement of your patterns might cut their cost 25 per cent.; a different method of molding them might double your production at no increase in molding cost. We can advise you and we have expert metal and wood patternmakers who are able to make any changes that may commend themselves to you.

## If you need some new Patterns

send us a sample, blueprint or sketch, and ask for our advice. It won't cost you anything. If our advice is good and commends itself to you, it is only fair to assume that our work will be equally satisfactory, and we need the work as badly as you need the patterns.

We are in a position to do turning, boring, drilling or other semi-finishing operations on castings supplied by us. Ask us.

***We have for our and your requirements, a large stock of assorted White Iron Stars, suitable for light agricultural to medium weight machinery castings, while they last, at 8 cents per lb. F. O. B. Galt.***

Made in Canada Grinding Wheels

## Times Have Changed!

In order to obtain grinding wheels of consistent quality, many manufacturers purchased imported wheels. But times have changed! It is no longer necessary to turn away from home-made goods.

Dominion Grinding Wheels are made in Canada of **abrasives from our own furnaces.** We have found that this is the only way to be **sure** the quality runs uniform to grade and grain.

Give Dominion Wheels a trial. You will find them equal to the best grade of imported wheels—and you save duty and exchange.

# HENDEY

Some machines are just like those chaps who suffer from temperament—they have to be humored and only work right when conditions are just so.

Is there any better way to avoid such machines than by taking into careful consideration the reputations for dependable service of the various machines on the market?

Take, for example, this 20-inch Hendey Crank Shaper. Undoubtedly you know some shops which are using at least one of these machines. Ask them their opinion as to its reliability.

**Your search for a thoroughly dependable shaper is ended when you investigate the Hendey.**

## The Hendey Machine Company

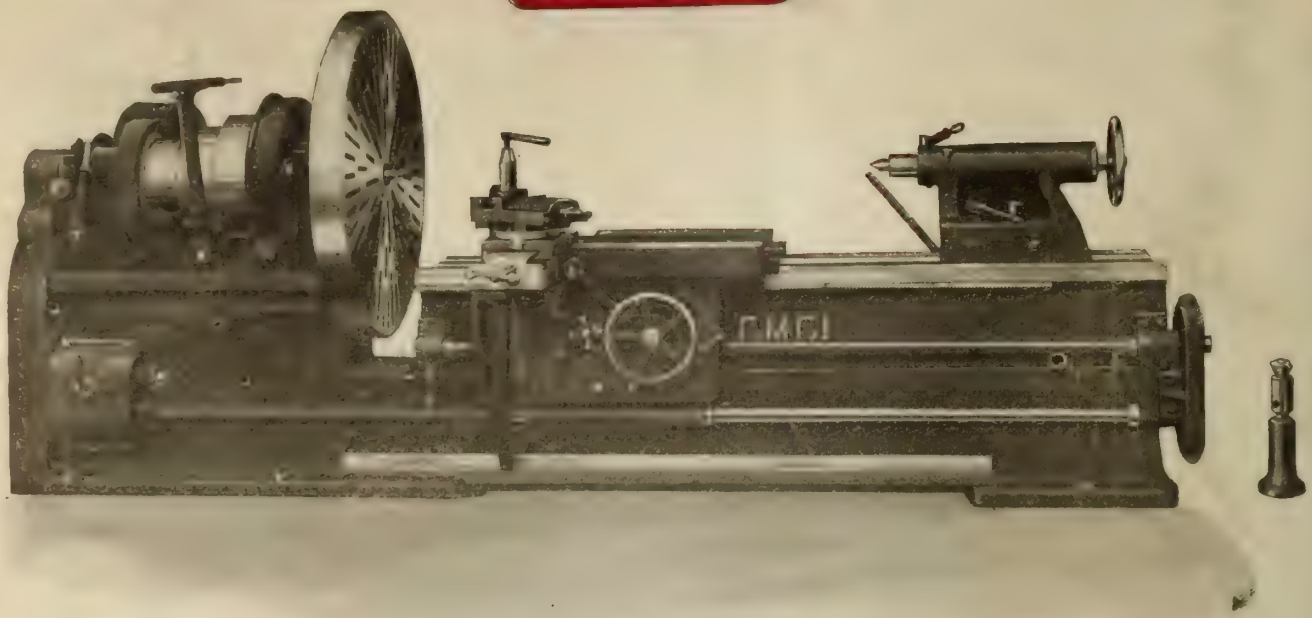
# Cab Tire Cable

## The Cable De Luxe for Industrial Purposes

This advertisement illustrates:

**A length of Northern Electric Cab Tire Cable**
**One Northern Electric No. 511 Marine Plug and Receptacle**
**One Northern Electric No. 407 Cargo Cluster**

This portable combination is specially adapted for use in shipping departments of industrial plants and in loading and unloading operations on board ships, in railway yards and in general construction work.



Cab Tire Cable is exceptionally flexible and durable and is ideal for use in localities where dampness or gas fumes abound and where other types of cable would be subject to mechanical injury.

Our nearest house will be glad to give your inquiries immediate attention.

# Canadian Built Machine Tools
## of
# The Highest Grade

Who got the $20,000,000 exchange premium on the Canadian Dollar last year for payment on imported goods?

Buy Canadian-made tools and help make the Canadian Dollar worth one hundred cents everywhere.

We build Machine Tools of the highest grade only, which are quite the equal of imported machines.

Besides, users of C.M.C. machines get the advantage of the service a home manufacturer can give.

## All the Fine Qualities That Good Work Demands

Pratt & Whitney Small Tools enjoy an enviable reputation for excellence that has been well earned in the high production shops of the country. Where stamina as well as exceptional accuracy and precision are required P & W Tools have more than held their own. Our line is complete. It includes taps, dies, milling cutters, reamers, punches, drills, etc., both of standard and special design and in sizes to suit every requirement.

Prompt service is assured at our nearest store, where P & W Small Tools are carried in stock for immediate delivery.

# CONDIT

## No Power Circuit Should be Broken with a Knife Switch!

CONDIT Type N-2 Oil Switch has a maximum capacity of 60 amperes and 600 volts and is ideal for protecting small lighting and power circuits. It is single throw and made either two, three or four pole, non-automatic or automatic with under-voltage release and overload protective fuses.
Made with knock-outs for Conduit Connections.

CONDIT Type 1 Oil Starters are of oil switch construction and are equipped with enclosed fuses for overload and short circuit protection. Special design allows fuses of approximately full load running current to be used, *which will not blow during starting period.* Equipped with low voltage release. Handle cannot be left in starting position.

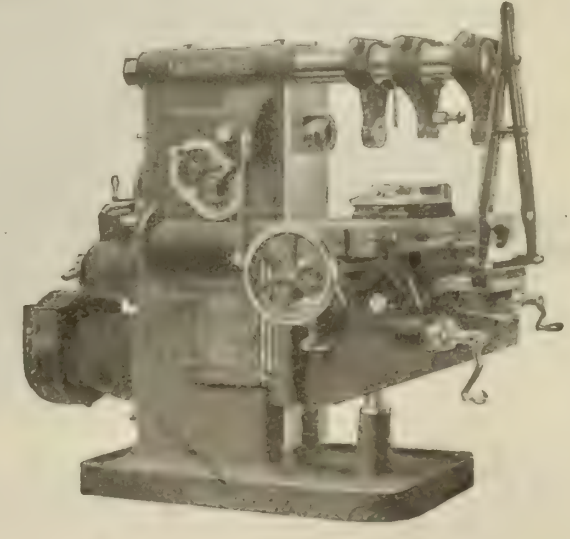
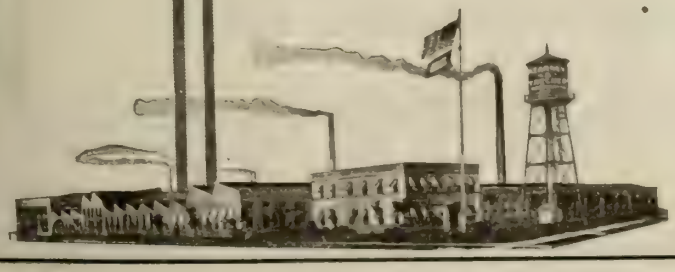
# MILWAUKEE MILLING MACHINES



## *Economy—The Demand Of The Day*



DISCRETION in the selection of machine tools means economy and profit. Equip your plant with machines that are built *right* to insure permanent satisfaction.

Milwaukee Milling Machines embody only the best obtainable materials and workmanship. Designed and constructed to afford maximum rigidity, accuracy, ease of operation, and to produce all classes of milling — profitably and economically.

Such features as the double overarm, flanged spindle, automatic flooded lubrication system and box section, solid top knee are largely responsible for the efficiency of Milwaukee Milling Machines.

An opportunity to assist you with your milling problems will be appreciated. Write for our catalogue.

*No. 20 COMBINATION TURRET LATHE*

Since 1889 we have specialized in Turret Lathes and their equipment. We build these machines in two types, the one intended for producing articles direct from bars, the other for machining detached pieces, either castings, forgings or stampings.

On receipt of samples or drawings of the work to be done, we offer the most suitable machine equipped with the necessary tools and fixtures, giving times in which we guarantee to produce each piece.

We have supplied Turret Lathes for machining all kinds of engineering details, and can furnish reliable advice on the most economical methods of production from design to finished article.

## MACHINES IN STOCK

# Class PLB-2 Compressors

**Bulletin K-301-A**

Successfully combined in these machines are all of the advantages of duplex construction and two-stage compression, without sacrifice of simplicity, compactness or strength.

They are easy to install, because, while practically a solid unit when assembled, they readily break up into sections convenient to handle and place on foundations, even in very close quarters.

Upkeep costs are low, due to their automatic flood lubrication system, enclosed dustproof construction, and the ready accessibility of all parts.

Equipped with a short belt drive attachment, they permit the use of standard motors, and are comparable only to the more expensive direct connected types in efficiency and output for floor space occupied.

Mimico, Ontario

# Would You Like to make some Extra Money?

Of course you would. Well then, why not do so? Canadian Machinery is always on the lookout for well-worth-while ideas, and are willing to pay a good price for them.

We are often asked, "What sort of ideas do you want?" Briefly, what we are desirous of obtaining is this, "Any idea that has proved of value in the machine shop, drafting room, or tool room." Think of how you got over some difficulty, a ticklish piece to hold in the lathe, or perhaps how you increased production on some particular piece. Any idea that saves time or money in the machine industry will appeal to us. Never mind the style. Write it as best you know how. We will put the finishing touches to both the wording and the sketch. Start in **NOW** and send us something of such a nature.

*Address it to*

Diamond-F

# DIAMOND FIBRE

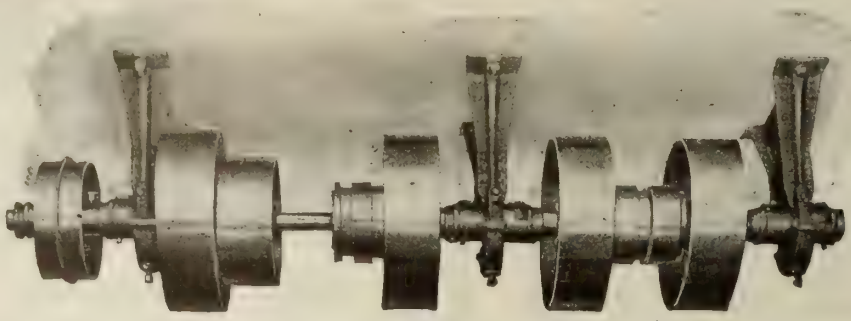
## Do YOU know exactly what Diamond Fibre is?

ANY proposition that will help to **increase** the product and **decrease** the production costs is worthy of investigation by those interested in manufacturing processes. And this is where Diamond Fibre is of interest to you.

Diamond Fibre is a superior grade of vulcanized Fibre (not wood pulp Fibre), tougher than horn, almost as hard as iron, yet lighter than aluminum and impervious to oil and grease. It contains no dirt, grit, metal, or other foreign substances and can be machined into any form without undue injury to the most delicate edge tools. This is why Diamond Fibre is, for many purposes, superior to the much more costly materials such as steel, brass, iron, etc.

It is a money saving advantage for you to specify Diamond Fibre gears, pulleys, receptacles, trucks, and the numerous different special shapes used in every industry.

Possibly it has not occurred to you that it would be of advantage to you to know more about the possibilities of Diamond Fibre in connection with your own business. The question of raw material is a mighty important one and the use of raw material most suitable to your particular need may mean very much increased efficiency at a lower cost.



Let us know about any production problem that is worrying you—any leakage in your production profits that you cannot trace and we will cheerfully give you our opinion on it. If we think Diamond Fibre will be of assistance to you we will say so. If we think not we will also say so frankly and you will have obtained the information at no cost to yourself.

Send for our book "Diamond Fibre and Its Uses." It will explain to you just what Diamond Fibre is and the different uses to which it may be put.

**Diamond State Fibre Company of Canada, Limited**

**Wrigley Building, Carlaw Avenue, - Toronto, Canada**

# THE JOHNSON FRICTION CLUTCH

## Put Johnson Clutches on Your Countershafts

Here's a countershaft equipped with three Johnson Clutches—two of the single type and one of the double—providing two speeds, a reverse and a light auxiliary drive. An exceptionally neat and compact construction is obtained, light in weight and smooth-running.

Wherever really high-grade equipment is desired, Johnson Clutches are the selection. For general transmission purposes there is no clutch more reliable, and none so adaptable to all conditions. Johnson Clutches in special types have also been incorporated successfully in machinery of all kinds. Their exceptional fitness for this line of work is described in our booklet, "Clutches as Applied to Machine Building."

**Write for our Yellow Catalog.**

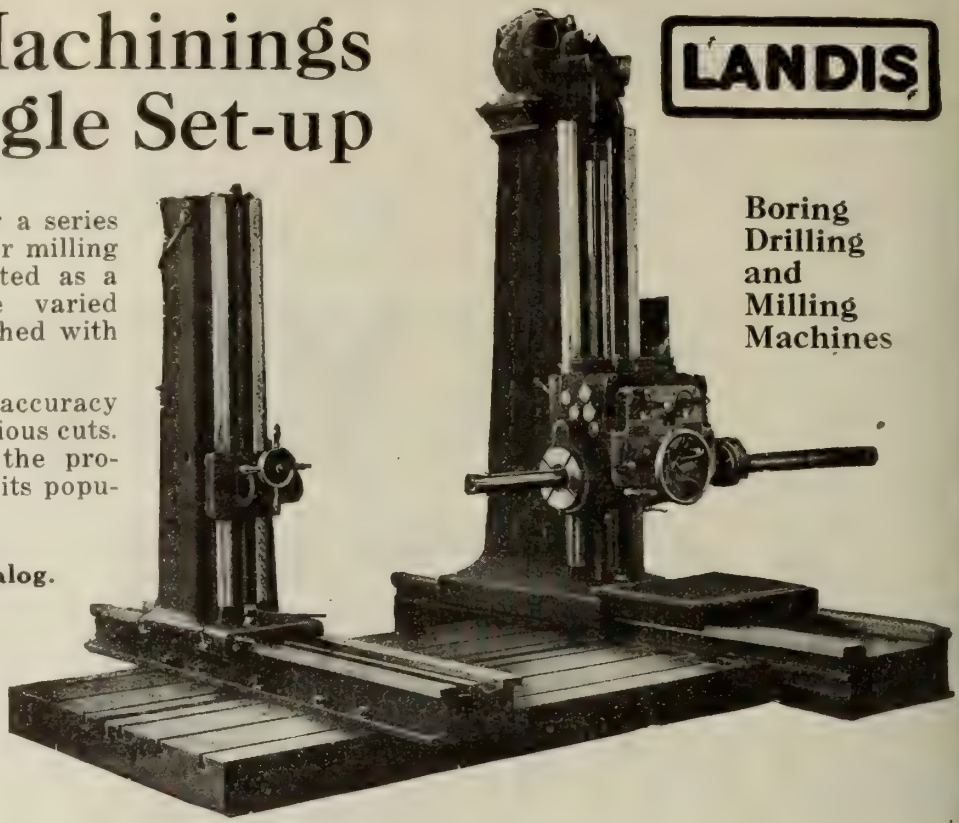
OPERATED IN CONJUNCTION WITH A CONTINENT WIDE NET-WORK OF DISTRIBUTION STATIONS

### "Liquid Air" Oxygen Means a Saving in Transportation

With a network of Factories, not only planned but in actual operation, and a number of Distribution Stations situated at all large centres all over Canada, Purchasers of Oxygen can obtain their supplies at a point very near to the point of consumption. This completely obviates heavy freight charges on cylinders and assures an immediate supply at any time within a few hours and even minutes after the orders are placed.

All cylinders conform to the specifications of the Canadian Railroad Board and are made to ensure safety without unnecessary weight. When purchasing "Liquid Air" Oxygen you not only save on freight, but in very many cases this expense is almost eliminated.



# Several Machinings With a Single Set-up

LANDIS

In machining parts requiring a series of boring, drilling, reaming or milling operations, the Landis is noted as a time saver, because these varied machinings can be accomplished with a single set-up of the work.

This feature further assures accuracy of alignment between the various cuts. The Landis looms large in the production class and this causes its popularity.

# Cleco Pressure-Seated Air Valves

## Bowes Air Hose Couplings—Cleco Never Slip Hose Clamps and Cleco Grooved Hose Nipples and Hose Clamp Tool

**STYLE O.F.** is an Outside Thread Female Pipe End. Made in sizes ⅜-inch to 1½-inch.

**STYLE I.F.** is an Inside Thread Female Pipe End. Made in sizes ¼-inch to 1½-inch.

**STYLE H.F.** is a Female Hose End with spiral shank to insert into the hose and has groove for the Never Slip Hose Clamp. Made in sizes ¼-inch to 1½-inch.

**STYLE H.M.** is a Male Hose End with spiral shank to insert into the hose and has groove for the Never Slip Hose Clamp. Made in sizes ¼-inch to 1½-inch.

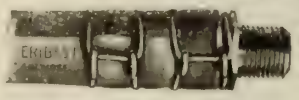
**STYLE O.M.** is an Inside Thread Male Pipe End. Made in sizes ¼-inch to 1½-inch.

**STYLE I.M.** is an Inside Thread Male Pipe End. Made in sizes ⅜-inch to 1½-inch.

The Male and Female Ends of Bowes Couplings interchange in sizes ¼-inch to ¾-inch. Sizes 1-inch and 1¼-inch interchange. The 1½-inch ends interchange only with themselves.

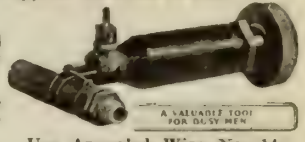
### BOWES COUPLINGS

Are instantly connected or disconnected.
They are absolutely air-tight under all pressures.
They quickly pay for themselves by stopping costly leaks.
They interchange in sizes most commonly used.
They have no loose parts to be mislaid or lost.
They are made of brass and will not rust.
The U-shaped Gasket interchanges in couplings ¼-inch to ¾-inch.



### CLECO VALVES

**Style P.O.** **Style M.O.** **Style A.**



Style P.O.—Made in sizes ¼ in., ⅜ in., ½ in., ¾ in., 1 in., 1¼ in., 1½ in., 1¾ in., and 2 in. Pipe Outlets. Inlets are one pipe size larger.
Style A—30° Angle Valves, are made in sizes ½ in., and ¾ in.
Style M.O. Valve—Has 1 in. Inlet and Bowes Coupling Outlet. Connects with Bowes sizes ¼ in. to ¾ in.

### CLECO GROOVED HOSE NIPPLES

Grooved Nipples when attached to the Hose with Wire Clamps as illustrated cannot "blow out." Wire clamp tool shown below applies the wires to hose.

**The Lightening Hose Clamp Tool** illustrated applies wire clamps at a cost of 1½ cents each.

**In stock:** Riveting and Chipping Hammers, Air Drills, Emery Grinders, Sand Rammers, etc.

**Use Annealed Wire No. 14**

**IMPORTANT:—The Small Leaks in your "AIR LINE" mean serious loss in DOLLARS. Have you any idea of the amount of "Air" wasted in small leaks at your connections? Air Leakage through 1-16 in. opening equals 5.32 cu. ft. per minute at 80 lbs. It will pay you to install Bowes Couplings and Cleco Valves, which will stop costly leaks.**

**Bulletins Nos. 43, 44, 46 and 48 mailed on request.**

**THE MODEL HOSE LINE** illustrated shows correct styles of couplings and valve to use and proper way to attach the Cleco Never Slip Hose Clamps to Bowes Couplings. No "blow-offs" can occur when "Cleco" Clamps are used.

# The New Canadian-Detroit Double-D Rolled Drill

***Made in Canada***

PRODUCTION requirements in an ever-increasing number of plants necessitate the use of a strong, accurate drill, specially designed for hard drop forgings, steel castings, and other alloy steels equally tough and difficult to drill.

For this service we have developed a hot rolled process drill known as the Canadian-Detroit Double-D (DD) Rolled Drill. It combines the strength of the forged type drill with the accuracy and uniformity of the milled type.

The flute of the DD is formed straight from the bar stock by successive passes through specially built and patented rolls at a temperature of 1850° F. This mechanical rolling of the flutes produces a refinement and uniformity in the grain of the steel and gives additional density at the centre and at the outer edge. Each drill is rolled separately, and the rolls are so designed and operated as to produce the same uniform increase in web thickness as is obtained in high-grade drills of the milled type.

The fluted drill is reheated and twisted in a specially designed automatic machine. The twisting process is held absolutely uniform, giving the same increase in helix angle from shank to point, 27° to 32°. This standard has been adopted on our milled drills and has been proven by exhaustive experiments to be the most efficient.

The DD has increased production and cut drilling costs in many of the finest plants in Canada. A fair test will convince you.

Manufactured and carried in stock at Walkerville in all sizes from ½ inch to 1½ inches.

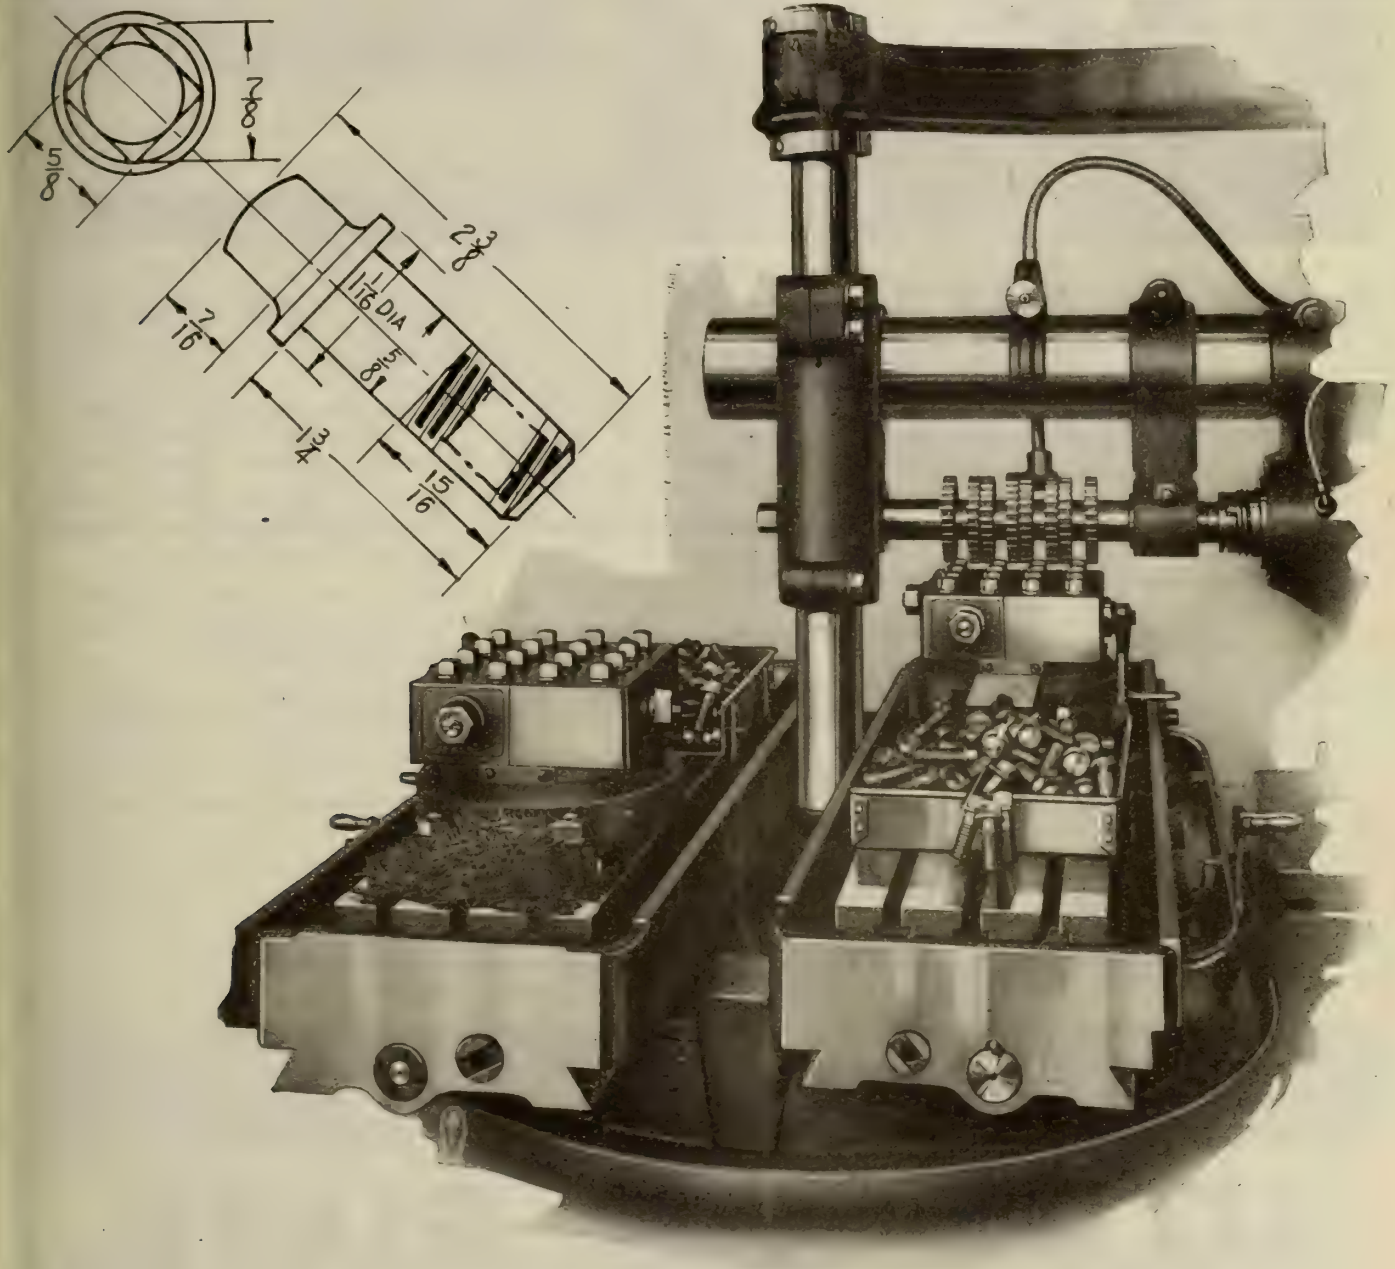
We also manufacture and carry in stock all sizes and types of high speed and carbon milled drills.

## CANADIAN-DETROIT TWIST DRILL COMPANY, LIMITED

**Walkerville, Ontario**

# Economical Milling of Square Head Screws

The fixtures used in this set-up are designed to carry 16 screws at each setting. After flats have been milled in the one operation, the table revolves to its loading position, and instead of removing the pieces and setting them up again to mill the other flats, the operator indexes the fixture 90°, which brings it in position for the next operation.



Ask for figures on the manufacturing proposition.

*While primarily built for close-quarters work, these air drills are popular for general service, saving delays in changing machines and lessening tool investment. Made in two sizes, and in either reversing or non-reversing types. No. 81 drills up to 1¼ inches in steel; No. 91 drills up to 2 inches. Ask for Bulletin 598*

# *A Little Giant that is preferred in and out of close-quarters*
## *—and 10 under-the-housings reasons why!*

Little Giant Close Quarters Air Drill sectioned showing:

**1** Train of sturdy stub-tooth gears. Made of special alloy steel. Transmits uninterrupted power to the drill spindle. No lost motion due to over-travel or slippage. 33% faster than drives of the ratchet type.

**2** Thrust ball bearing carries feed screw pressure. Note spindle gear forged integral with spindle.

**3** Roller bearings support gear train. Ample provision for thorough lubrication of working parts by means of "splash" system.

**4** One-piece, solid forged steel crankshaft, having two throws with pins at 90 degrees. Crankshaft is of ample proportions and strength throughout.

**5** Crossheads prevent side wear of cylinder walls and pistons. This construction parallels high-grade steam engine practice, insuring permanent alignment and long life of reciprocating parts.

**6** Balanced piston valves fitted so that only room for the oil film is allowed. Provides a near perfect seal and requires the minimum of power to operate. Result—long life of parts and highest economy.

**7** The valve pistons operate in replaceable, long-wearing bronze bushings, insuring long service and low upkeep cost.

**8** The sturdy forged steel toggles and connecting rods are capable of withstanding the severest service.

**9** The pistons are machined from solid stock, heat treated and ground to size, resulting in longest wear.

**10** Standard Little Giant throttle control permits ease of operation with consequent increased production. Little Giant is the only close-quarters air drill which can be reversed from the throttle.

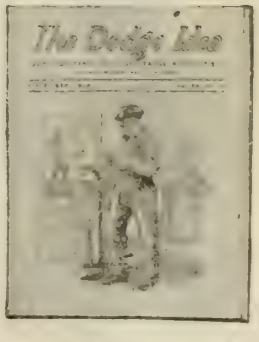
Group Driving showing milling machines and planers driven by line shafting connected to a motor—Dodge Clutches permit the individual operation of machines.

# DODGE

## Group driving prevents overloading the electric motor



Line and counter shafts are the one sure protection of your electric motor. Direct-connected equipment is expensive—a high first cost and abnormal repair charges if overloads occur.

A group of machines driven by motor in many instances solves the problems of economy and efficient production.

The line shaft equipment produces a fly wheel effect that absorbs a sudden overload, thus protecting the motor against damage.

The installation of Dodge friction clutches and cut-off couplings permits the use of one or two machines, or the entire group.

Let us tell you more about "group driving"—let us show you comparative costs obtained from actual installations where manufacturers experienced unexpected savings in addition to more efficient service from such equipment.

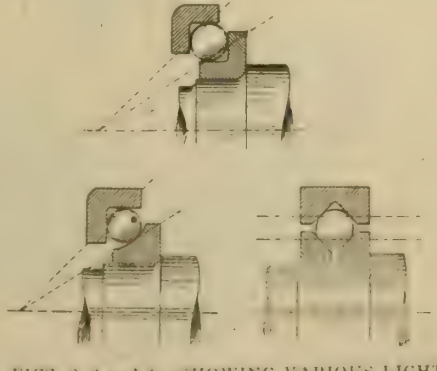
# CANADIAN MACHINERY AND MANUFACTURING NEWS

VOL. XXV. No. 8. February 24, 1921

# *Ball Bearings and their Usefulness to Industry*



Light Type Bearings—Evolution of Modern Ball Bearing — Thrust Bearings — Some Advantages of Ball Bearings.

*By Gordon Janes*

ACCORDING to the dictionary, a bearing is "that part of a machine which receives the friction." This being the case, it would be necessary to go back much further in history than any existing records permit, to ascertain when the first bearing was used. Nevertheless, from very early times—indeed, long before Archimedes, or even the Pyramids — the wastefulness of plain sliding friction was realized and the fact was appreciated that a weight could be moved with little effort on rollers or balls. But at this point progress in anti-friction science halted for many centuries, as it seemed impossible to find durable rolling members; and the cost of even the simplest anti-friction bearing deterred efforts in that direction until the advent of the bicycle.

The rise of the bicycle and the consequent need of conserving the very limited energy of its human motor brought forth numerous types of two, three and four-point ball bearings of cup and cone and other types; and for the very light service required, these types served very well. Some of these are illustrated in Figs. 1, 2, 3, 4 and 5. All are familiar and all share certain technical features. However, they are all distrusted to-day, due to their inability to endure the heavy loads or high speeds demanded in serious commercial work.

FIGS. 2, 3 and 4. SHOWING VARIOUS LIGHT SERVICE BEARINGS, ALL OF WHICH ARE NOW DISTRUSTED FOR COMMERCIAL WORK.

Thus, while the bicycle performed a great service to anti-friction engineering in making the ball bearing an accomplished fact, it, on the other hand, did much harm to the science, by creating an atmosphere of distrust as to the suitability of these bearings when applied to machines where the service required of them was heavy.

These ball bearings wore out rapidly, for several reasons, none of which were fully understood at first. Among the reasons was inaccuracy of form, which resulted in the load being supported by only one ball at a time. A second reason, which could not be overcome with the steels than in use, was the insufficient hardness of both balls and races. A third, was the failure to exclude dirt, which entered and acted as an abrasive, rapidly destroying both balls and races. A fourth reason was that the cup and

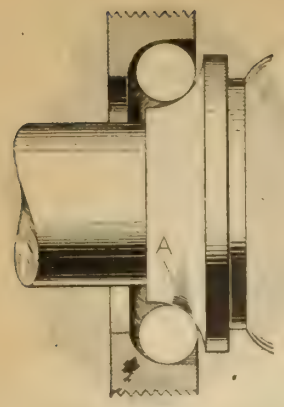


FIG. 5.—ANOTHER TYPE OF EARLY STYLE LIGHT TYPE BEARING.

cone designs first employed, whether of the two, three or four-point type, did not give the balls a pure rolling motion. There was always a spinning (and therefore rubbing) movement in addition. A fifth reason was that adjustability, once thought to be essential, proved to be a serious disadvantage, for no two users set their bearings alike. They either left them too loose or too tight, which compelled one or two balls to take all the load. This, of course, crushed both balls and races. The familiar cup and cone bearings of bicycles and other light machinery have been successful only because of the very light loads employed.

### Evolution of the Modern Radial Ball Bearing

In 1898, Professor Stribeck commenced an exhaustive series of tests on the whole subject of ball bearing performance and design. Briefly stated, the tests, which extended over some years and cost a veritable fortune to make, showed that the condition of successful operation lay simply in the elimination of the usual factors of error, which until then had been deemed of no importance.

Since in a ball bearing the load is borne, not on a liberal surface, but by a few points whose area is due solely to microscopic flattening of the balls and races themselves, and since the loads at these points are not cushioned by an oil film, as in plain bearings, but are carried with direct metal to metal contact, it follows that the materials used must be of extraordinary toughness and hardness. From their very hardness, the balls and races are virtually incompressible, and it follows that errors, negligible in other machinery, simply will not do in ball bearings. If a ball is ever so little over size, it takes the load from its fellows, resulting in abnormal pressure at the points of contact. If undersized, it gets no load, with equally bad results. It is a fact that even a fine watch does not require such minutely exact construction as a durable ball bearing.

The need for uniformity does not end with matters of size and shape. The balls must likewise be uniform in hardness, both between ball and ball, and between different portions of the same ball. It will not even do to have a ball hardened merely on its surface. No two balls thus treated would have exactly the same compressibility, and no two would wear exactly the same. The only safe course is to have every ball hardened right through from surface to centre. A soft ball will show a coarse crystalline structure in its centre when fractured, with increasingly closer and finer grain toward the hardened surface. Some microphotographs of ball fractures are shown in Fig. 6, the right hand ball showing how fine and even a structure it is possible to obtain with proper methods of manufacture.

The relative position of balls and races and the shape of the races themselves underwent numerous changes before the present-day type of annular bearing was evolved. At first there were many attempts to employ a series of rows of balls but in none of these was proper provision made for taking care of the deflection of the shaft under load. After every effort to provide a proper load distribution had failed the simple plan of using a single row of balls was adopted. This resulted in a journal having no appreciable length and accordingly free from deflection. But as the number of balls in a single circle was necessarily limited, it became important to develop the carrying capacities, as affected by the shape of the ball tracks.

### Frictional Resistance

It was found that the frictional resistance was best for balls rolling between straight line sections, or perfectly flat surfaces, giving two points of contact. Increasing the points of contact to three and four, produced higher frictional resistance without materially affecting the carrying capacity. Curving the raceway, however, resulted in an important increase in the carrying capacity. As many believed that the capacity of the bearing would be increased by employing more balls than could be introduced into the bearing by eccentric displacement of the races various forms of filling slots were provided to accomplish this result. Other things equal, this would be true, but it must be remembered that the race cross section plays a vital part in determining the carrying capacity, and any device — such as filling slots, etc. — employed for the insertion of a larger number of balls than can be gotten into the bearing by eccentric displacement, weakens the race and hence results in a decreased carrying capacity.

To Conrad belongs the merit of eliminating the filling opening altogether, and providing an annular bearing of continuous race and uninterrupted groove. Incidentally, this eliminated all troubles due to interference between balls and filling opening. The bearing illustrated in Fig. 7 is the now familiar form of a single row, deep groove bearing manufactured under Conrad's patent. This type of radial bearing will also carry a considerable thrust—that is, load parallel to the axis of the shaft. The reason for this high thrust capacity will be seen from an examination of the race sections in Fig. 8, the groove in the right hand race being very deep.

In 1907, Mr. Sven Winquist, a resident of Sweden, invented and marketed a ball bearing which, owing to its design, is peculiarly adapted to practically all types of machinery, in that it embodies features which are unique and quite distinct from any other ball bearing designs. This bearing is shown in Fig. 9. As will be seen from the illustration, the inner race of the ball bearing contains two grooves, each ground

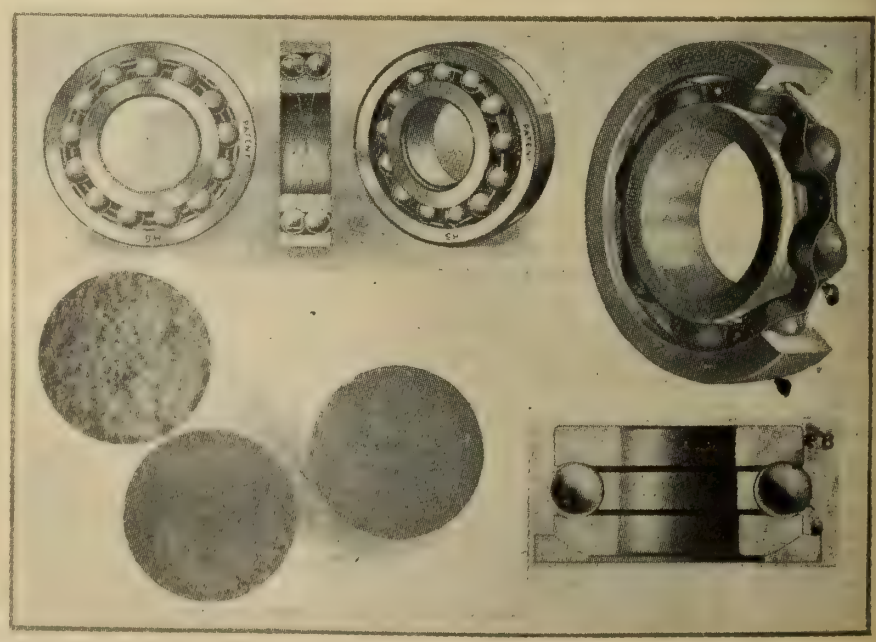

FIG. 9.—LEFT UPPER VIEW. FIG. 6.—LEFT LOWER VIEW. FIG. 7.—RIGHT UPPER VIEW. FIG. 11.—RIGHT LOWER VIEW.

to a radius slightly larger than the radius of the balls. The outer race is ground in the form of a section of a hollow sphere, whose centre

FIG. 13.

of the axis of rotation. As will be seen from Fig. 10, the two rows of balls and inner race are free to rotate at any angle within this spherical outer race without subjecting the races to any undue strains, allowing a perfect ball and socket or self-aligning action. The ease with which this bearing functions under all conditions of shaft misalignment will be appreciated when it is pointed out that the balls roll on the surface of the spherical outer race with a pure rolling motion.

### Thrust Bearings

For carrying thrust, that is, load parallel to the axis of the shaft, a special form of bearing called a "thrust" bearing is employed. In this, the ball tracks are arranged in planes at right angles to the shaft axis and ground concentric with the bore of the bearing to a radius slightly larger than the radius of the balls. In order to secure the full carrying capacity, the two thrust plates or collars must be absolutely parallel. Even so small a deviation as a few ten-thousandths of an inch will concentrate the entire load on a few balls at one side — overload these — and reduce the bearing capacity. Therefore, to secure exact parallelism between the shoulders on the shaft and the housing seat, even under deflection, and the small yet important and unavoidable errors of workmanship, one collar is generally given a spherical surface on the outside, which permits it to adjust itself in the corresponding spherically machined seat of the housing and thus secure the exact parallelism required.

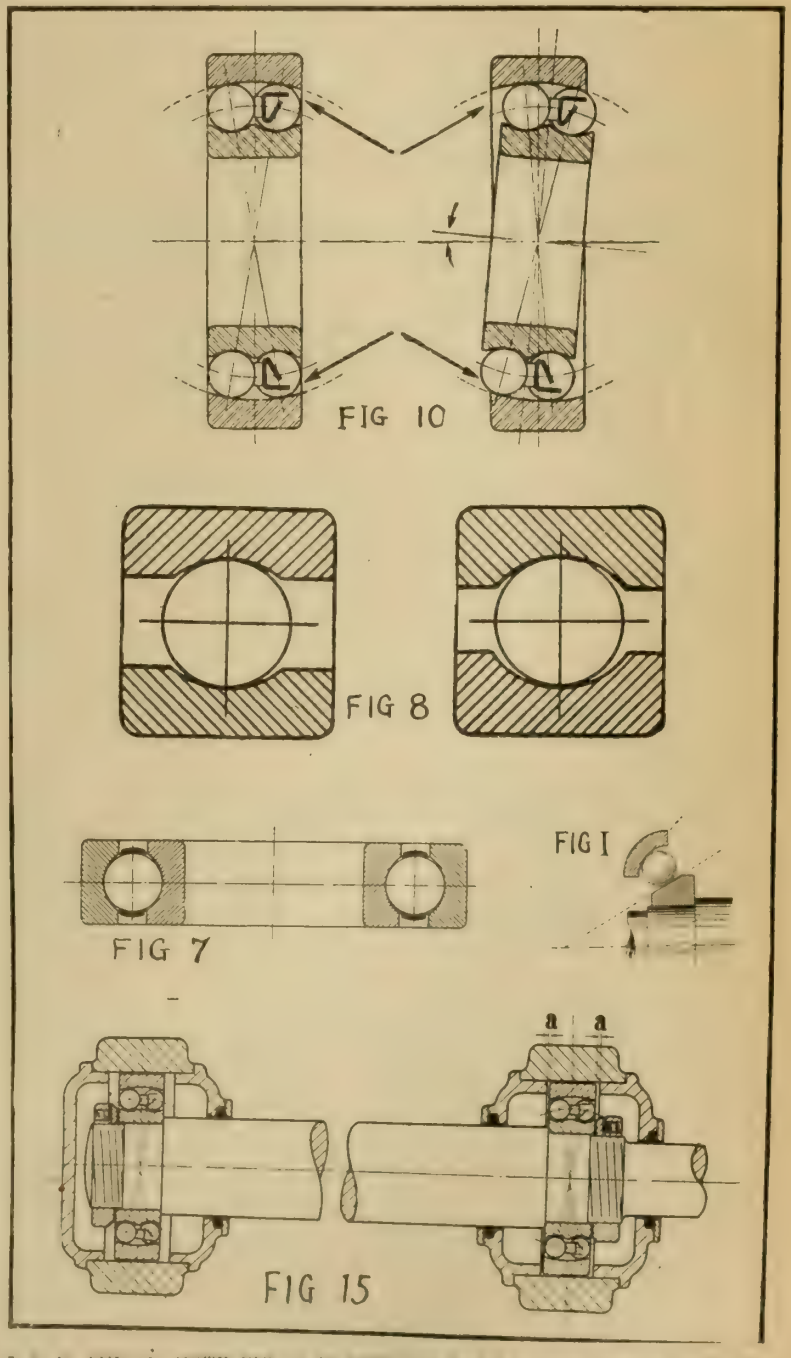

Fig. 11 is an example of a single thrust, self-aligning bearing. The drawing shows this provided with a spherically-ground washer which permits of the bearing being mounted in a flat seated housing without special and difficult machining. It will be noted that the upper ring has a smaller bore than the lower and revolves with the shaft to which it must be securely fixed. Of course, self-aligning thrust bearings are not always essential and in that case both collars are plain rings similar to the upper collar of the bearing shown in Fig. 11. Such a bearing works well, provided it is accurately lined up when first mounted and there is no opportunity for the shaft to deflect while in operation.

The bearings just described are both of the single thrust type—that is, they take load in one direction only, but cases often arise when the load may have to be carried from either side—requiring a bearing of what is called the double thrust type. Such a bearing consists of three rings or collars with two sets of balls—the middle collar of the group being the one to grip and revolve with the shaft and the two outside collars resting in the housing. As in the single thrust bearing, these outer collars may be spherically ground to make the whole unit self-aligning. The centre of this spherical assembly coincides with the axis of rotation. The bearing illustrated in Figs. 12 and 13 is a self-aligning, self-contained double thrust unit. It possesses the great advantage of being easily mounted since there is only one part to handle, and the accurate and, therefore, costly, machine work, often required is greatly reduced.

### Some Advantages of Ball Bearings

A great advantage of ball bearings is the saving of power. The University of Wisconsin made a test some time ago which illustrated that roller bearings required the least amount of power, and that an increase in speed had little effect on the bearings.

As the motion in an annular ball bearing is one of pure rolling, the starting

FIGS 1, 7, 8, 10 AND 15. NOTE FIG 15 IS USED ON PART 2, AND IS NOT DESCRIBED IN THIS PORTION. FIG. 7 IS A SECTION OF THE VIEW SHOWN IN PHOTOGRAPH ON PAGE 34.

friction is no greater than the running friction. This is a very important fact, for as it is not necessary to provide for heavier starting loads, a much smaller motor may be used. Shafts in cast iron, babbitt or bronze bearings frequently become "set" if the equipment is idle for any length of time. The oil is pressed out of these bearings and it is extremely difficult to start the shaft from rest. In addition to the saving in power, there is a saving in lubricant, due to the fact that the oil or grease is sealed in the bearing chamber, which is of sufficiently large dimensions to contain enough lubricant for many months' running. A direct result of this is increased cleanliness and freedom from the annoyance of dripping oil. The bearings, being enclosed in dust-proof housings, can be run under conditions of dust, moisture and grit that would quickly spell ruin to a plain bearing. In a later issue we will consider the mounting and installation of ball bearings.

*MORE TO FOLLOW*

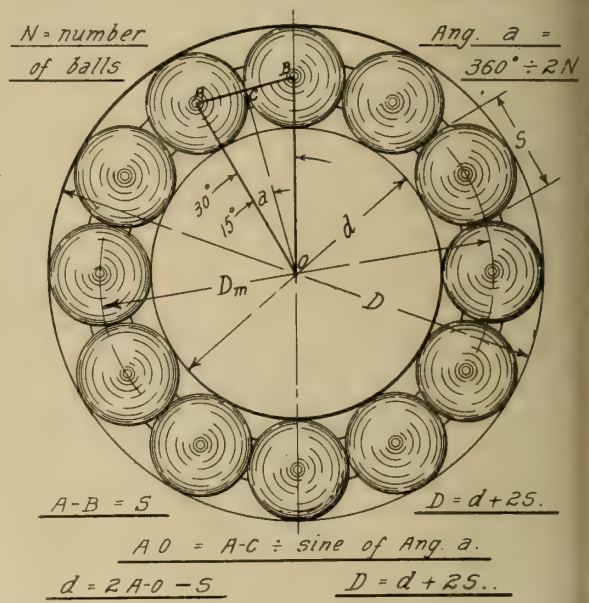
*The author of this article is Toronto manager for the SKF Ball Bearing Co., and is naturally an authority on the subject. He has had a varied experience in ball bearing installations, and will tell us in his next article about different types of machines that have been successfully equipped with ball bearings. This will appear March 17th, and is well worth watching for.*

# Two Ideas That are Well Worth Remembering

## BALL BEARINGS

### Finding Diameter of Ball Race

Herewith are diagram and data for finding the diameters of ball races, when a certain number of balls of a given diameter are to be used, all balls touching.



Example:—Twelve ⅞-inch balls are to be used in a radial bearing; what must be the two diameters d and D, when all balls just touch each other?

AB = S the diameter of the ball.

$$AO = AC \div \text{Sin of angle (a)}, \text{ or } \frac{.875}{2} \div .25882 = 1.69 \text{ in.}$$

$$\text{Diameter (d)} = \frac{2AO}{S} = 3.38 - .875 = 2.505 \text{ in.}$$

Diameter D = d + 2S = 2.505 + 1.75 = 4.255 in.

## BALL TURNING

### Fixture for Turning Balls on a Drill Press

Shank A, which fits the drill spindle, is provided with slide to carry the two adjustable tool blocks B. Tools C may be set equal distance from the central line by means of a rod in the hole L. Base of holding fixture D has a slotted quadrant E, which permits incline adjustment. Head G swivels from the shaft that carries the worm F, the latter meshing with worm gear I keyed to the hollow spindle H. Collet chuck and draw spindle (hollow) is fitted inside of H, for holding work, secured by means of wheel K. Fixture may be revolved by hand, or by pulley placed on worm shaft. Tools are slowly fed to the work while spindle revolves.

# Advisability of Standardizing Jig Design

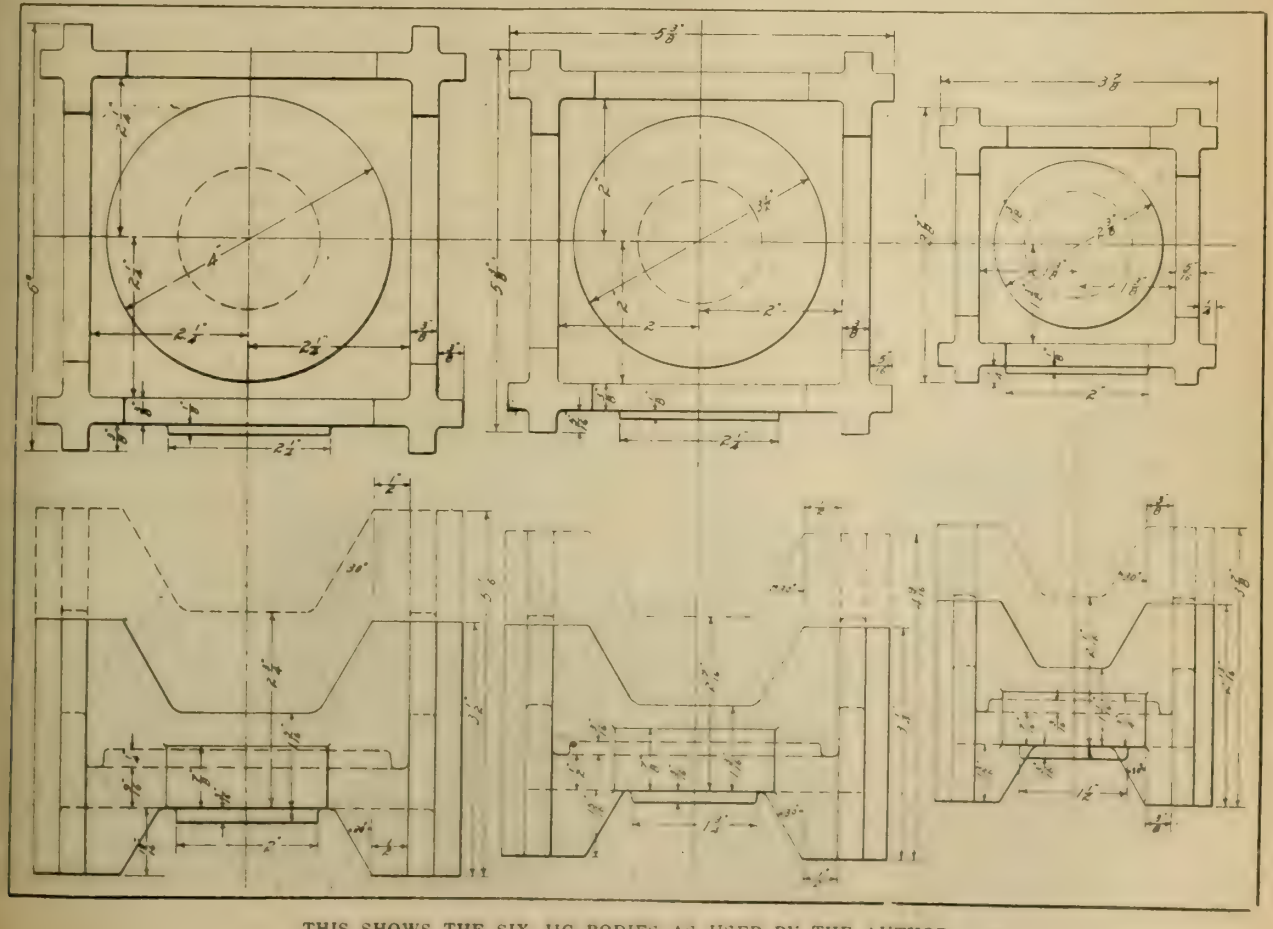
*By Robert Mawson*

ANYONE who has followed machine shop practice during the past few years, say a decade, will agree that the greatest change has been in duplicate machinery operations. About ten years ago special tools such as jigs and fixtures were the exception rather than the rule in most plants.

The automobile industry has been the great leader in this matter. The writer can well remember where, in the early stages of automobile making, each part was made by trial to fit other components. One can readily see what this meant when repair parts were necessary —the question of repair was then almost a tool room proposition.

Let me cite one case that was followed out in our plant. We had certain cylinders that were cast in pairs. The sequence of operations when machining the bores to suit the pistons was as follows: They were first roughed out with a one point tool, which was then followed with a multiple tool; in other words, a bar having a number of cutting tools. The holes were next reamed approximately to size. A long cast iron lap charged with abrasive and oil was then moved by hand up and down the bored hole until the surface was smooth and brought to size. Each piston was then fitted to one of the holes in the cylinder, and woe be to the workman if he should get these mixed or misplaced, as we scarcely ever found two just the same diameter.

Somewhat similar haphazard methods were also used for other operations, such as milling and drilling. On drilling operations, the earlier method was to lay the positions out with height gauges, etc., the operator working to guide lines when machining. The next development was the use of templates for the drilling operations, but at best these are only makeshifts, as their accuracy depends largely on the care exercised by the man using them.



As the automobile and other machine building developed, and in order to meet the demand for new and repair parts, the need of special machining tools was created. This demand also provided for a new profession in the engineering field, namely, tool designers.

This work is quite different from the machine designer's who deals largely with known factors, such as friction, stresses, etc. The tool designer is called upon to deal with an unknown factor—the human element. To meet this requirement he must use very generously his common sense. For this reason, jigs, fixtures, etc., are made fairly heavy and rigid—stresses do not enter into the question. Further, tools should be made as near as possible FOOL PROOF. There are still a few of these people left in the machine shop, and one might be called upon to use the tools.

Some tool designers come via the machine designer route, whilst others step up from the machine shop and tool room. This is perhaps unfortunate in both ways; the designer does not know all he should know about the shop end, and the shop man is usually lacking in designing knowledge. This condition, no doubt, accounts for many of the freakish tools often seen in service.

The question of making patterns for tools is also a matter for consideration. Often only one tool is made from a pattern, which makes the proposition a

# Turret Lathe Applications

The tooling necessary for machining an axle housing, a motor frame, and a piece of work weighing over 600 pounds.

*BY J. H. MOORE*

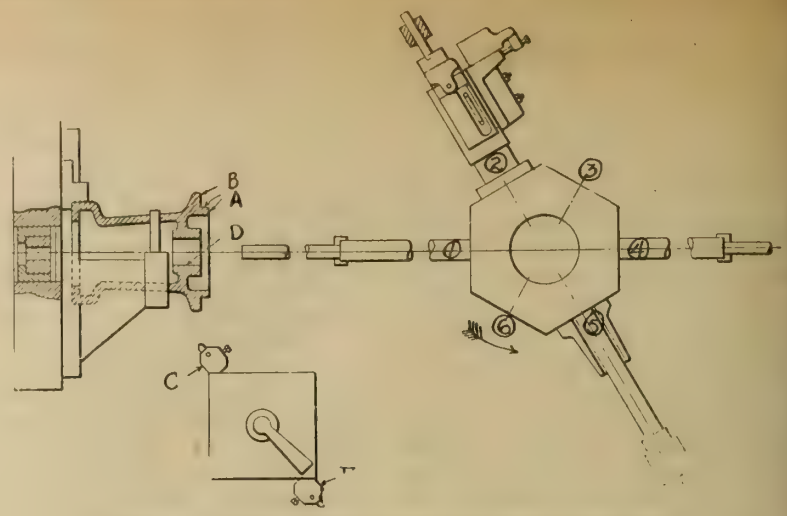

FIG 2—LAYOUT OF TOOLING USED IN FIRST OPERATION

TOOL layout is a study of extreme importance if the best results are to be obtained from any style of turret lathe. This article depicts various examples of work performed on Gisholt turret lathes, and illustrate the benefits of a well planned layout.

At Fig. 1 is shown an axle housing that is used on a tractor. The portions machined in the turret lathe are marked in heavy lines on the sketch. Owing to the irregular shape of this piece, a special fixture, or chuck bonnet as it is often termed, is employed in the second operation for holding the work. The housing is made of cast iron, and the work about to be described was performed on a 24-inch machine.

At Fig. 2 is shown a diagram of the tooling equipment used on the first operation. This work consists of machining the front end of the housing, also boring and reaming the hole. The operations are completed as follows: The housing is held in a special fixture which has an arm that encloses the work, and steadies it near its outer end. This arrangement can be clearly noted at Fig. 2, although Fig. 3 illustrates the fixture still better.

The surfaces A and B are first rough turned and faced with the tool C in the toolpost. The hole D is next rough bored with the cutter held in boring bar at position 1 of the turret. Reference to Fig. 3 will show this bar starting its cut. The hole D is now finish bored with the cutter in the boring bar at position 4 of the turret. In both the rough and finish boring operations the bar is guided by means of a pilot that enters a bushing in the chuck. This bushing is clearly shown at Fig. 2.

The hole D is next reamed with the reamer at position 5 of the turret, after which the surface B is finished with cutters held at position 2 of the turret. During this operation the head is steadied by a bushing on the end of a pilot. This bushing enters the completed hole D, and ensures the concentricity of the

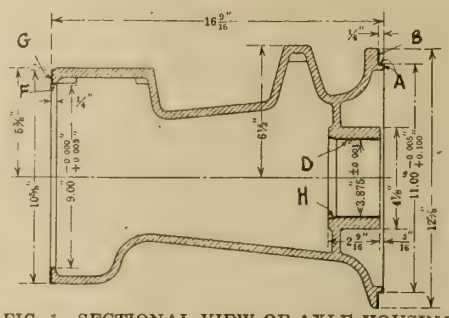

FIG. 1—SECTIONAL VIEW OF AXLE HOUSING FOR TRACTOR.

surface at A. The shoulder B is next finished with the tool E held in the toolpost. This completes the first operation, and the time expended is 8 minutes.

### Second Operation

The second operation layout is shown at Fig. 4, and this work consists of machining the surfaces F and G, also chamfering the portion H, together with tapping the hole J. As already stated, a special chuck plate to hold the work, this plate being attached in turn to the regular faceplate of the machine. The method of holding the work is clearly seen in Fig. 5, which is a close up of the fixture we speak of. The method of carrying out the steps of operations are as follows:—

The housing is mounted on the chuck plate as shown, and held with clamps. The surface G is rough faced with the tool L held in the toolpost. The hole F is next bored and a chamfer produced at H by means of the cutters held in the head at position 1 of the turret, the head being guided by means of pilot that enters the bushing K in the chuck plate. The surface G is now finish faced with the tool H held in the toolpost. The hole at J is the final step, and this is tapped with a tap mounted at position 4 of the turret. The complete operation takes 6 minutes to perform.

### Machining Motor Frame

The next example, Fig. 6, is that of a motor frame machined on the surfaces shown by the heavy lines. Two operations are necessary to complete this piece, and the auxiliary toolpost of the lathe is brought into play as well as the turret and regular toolpost tools. This work is also produced on the 24-inch size of machine. The piece is made from cast steel, and the tool layout for the first operation is shown at Fig. 7. At Fig. 8 is depicted the method of holding the motor frame during this operation.

FIG. 3.- BORING THE HOLE IN FIRST OPERATION.

FIG. 5.—HOLDING THE WORK IN SECOND OPERATION.

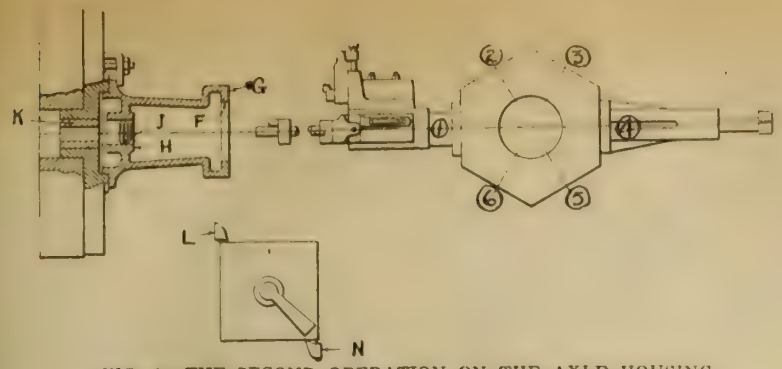

FIG. 4.—THE SECOND OPERATION ON THE AXLE HOUSING.

Here are the steps followed during the first operation.

The work is held in place with special hard chuck jaws, these having clamping screws as shown at Fig. 7. The surfaces A and B are rough bored by the tool C in the toolpost. The surfaces E, F and G are next rough turned and faced by the tool D in the toolpost. After this the outside of the housing at H is rough turned with the tool J held in the wing rest. The outside H is then finished with the tool K held in the wing rest.

The hole L is now rough and finish bored with the cutters held in bar at position 1 of the turret. The end of this bar is piloted in the bushing in the chuck shown at Fig. 7. A second roughing cut is next taken on the surfaces A, B, E and F with the cutters in the head at position 2 of the turret. After this is completed the surfaces A, B, E, F and G are finish turned with the cutters in the head at position 5 of the turret. It will be noted that both these heads, that is, at position 2 and 5, are guided by pilots that enter the bushing in the chuck, also with a bushing that enters the bore L. This arrangement guarantees that the finished surfaces will be concentric. The total time on these various steps is 35 minutes.

### Second Operation

The diagram for the second operation is shown at Fig. 9, while the photographic view of the same operation is shown at Fig. 10. The work is held on a special chuck plate as shown, clamps securing the piece tightly. After this is done, the work goes through the various steps.

The motor frame is first centered on the chuck plate and the clamps tightened. When this is completed the surfaces M, N and O are rough machined with tool P in the toolpost. The outside surface R is turned with tool S in the wing rest, and the bore T is started with

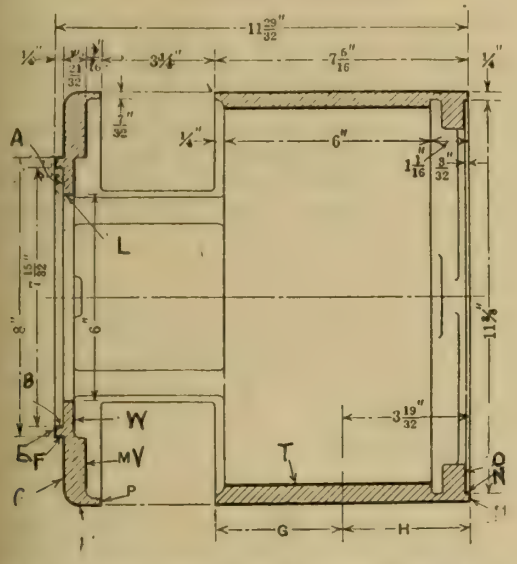

FIG. 6.—SECTIONAL VIEW OF A MOTOR FRAME.

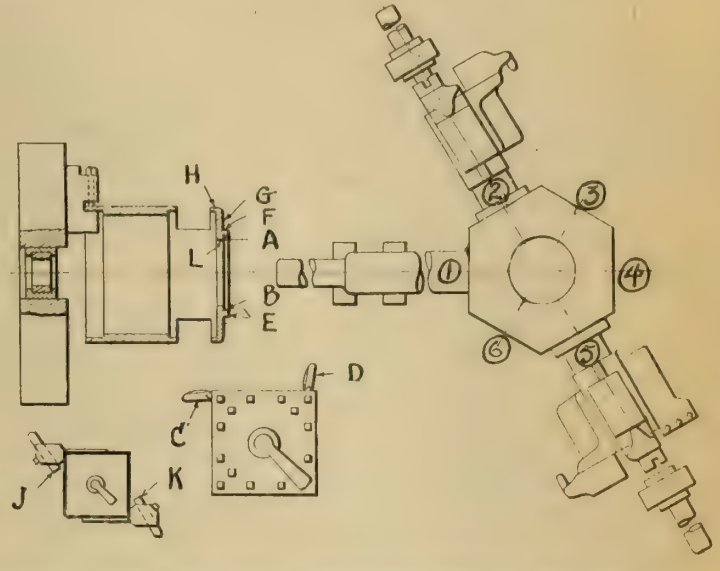

FIG. 7.—TOOL LAYOUT FOR FIRST OPERATION ON MOTOR FRAME.

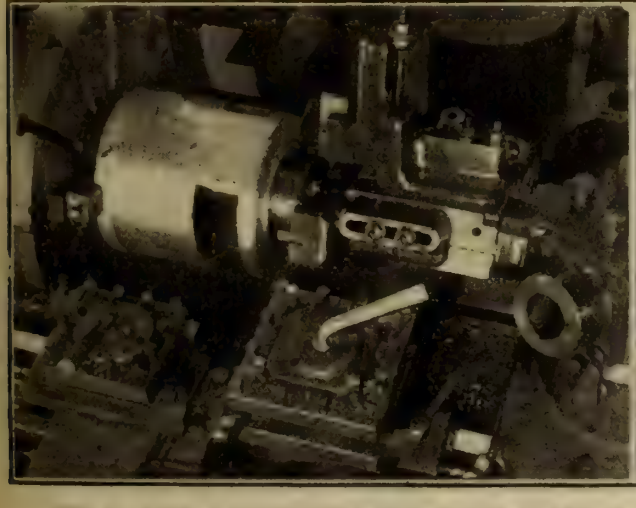

FIG. 9.—VIEW ILLUSTRATING HOW MOTOR FRAME IS HELD IN FIRST OPERATION.

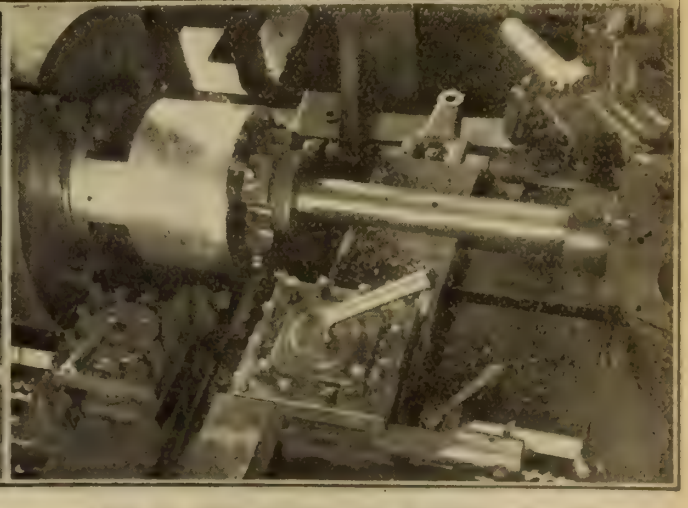

FIG. 10.—THE METHOD OF HOLDING THE FRAME IN SECOND OPERATION

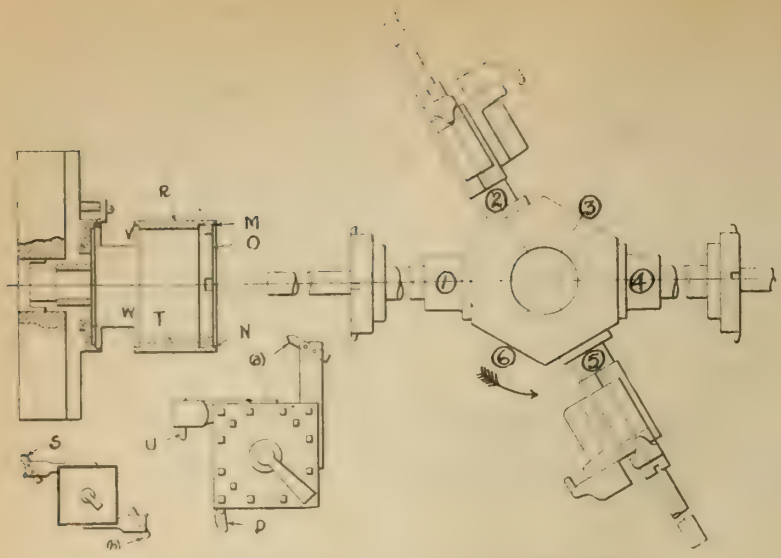

FIG. 9.—SECOND OPERATION ON THE MOTOR FRAME.

the tool V in the toolpost. The bore T is now rough bored with the cutters held in the head at position 1 of the turret, and the same hole is finish bored with the cutters held in the head at position 4 of the turret. Both these heads are guided by a pilot that enters the bushing mounted in the chuck as shown at Fig. 9.

The surfaces M, N and O are next rough turned with the cutters held at position 2 of the turret, and the same surfaces are finished with the cutters in head at position 5 of the turret. The shoulders V and W are finished with the tool (a) held in the toolpost, while the outside surface R is finish turned with the tool (b) held in the wing rest. This completes the operation and the time consumed on this work is 45 minutes.

### Machining Heavy Work

The remaining example in the present article is shown at Fig. 11. The drawing depicts a very large piece of work that weighs over 600 lbs., and is made from cast steel. It is machined on a 28-inch machine, and shows clearly the possibilities of handling large work on such a type of machine. This example also illustrates the benefits of using multiple tools for boring different sizes of holes.

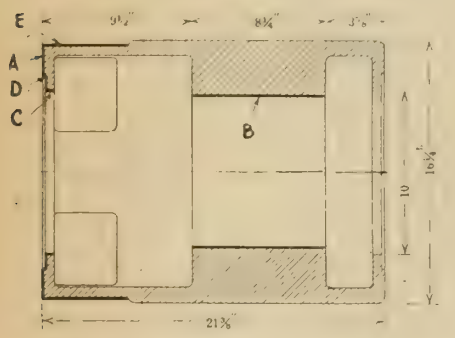

FIG. 11.—AN EXAMPLE OF HEAVY WORK COMPLETED ON A TURRET LATHE.

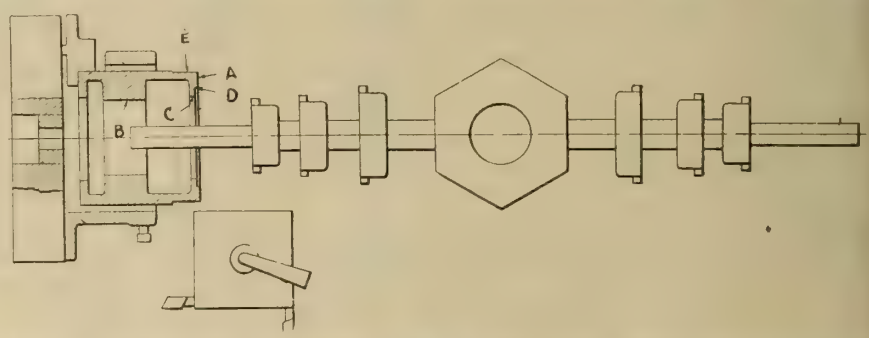

FIG. 12.—THE TOOLING EQUIPMENT USED IN THE FIRST OPERATION ON THE PIECE SHOWN AT FIG. 11.

The tool layout for this part is shown at Fig. 12, while the photographs, Figs. 13, 14, 15 and 16, illustrate other particulars regarding the work being performed. Let us consider the work step by step.

Two operations are necessary to complete this part, and the first of these proceeds as follows:—

A special fixture is used to support the casting, and this is of the sometimes termed, bonnet design, being so called because it bonnets or gives support to the casting at a considerable distance from its end. The end A is first faced with a tool held in the toolpost, after which the holes B and C are rough bored. The counterbore D is now rough machined with the multiple tool heads held in the turret. The bar on which these heads are held is guided by a bushing in the chuck as shown at Fig. 12.

At the same time as the casting is being rough bored, the outside of the casting at E is rough turned with the tool held in the toolpost, after which the same surface is finish turned. Upon this being completed the holes B and C, also the counterbore D, are finished with the multiple cutter heads in the turret. These heads can be noted at Fig. 14.

### Second Operation

In this operation, the casting is held on a face plate that is provided with clamps. Both the face plate and the clamps can be clearly noted at Fig. 15. The work after being located and clamped in position is shown at Fig. 16.

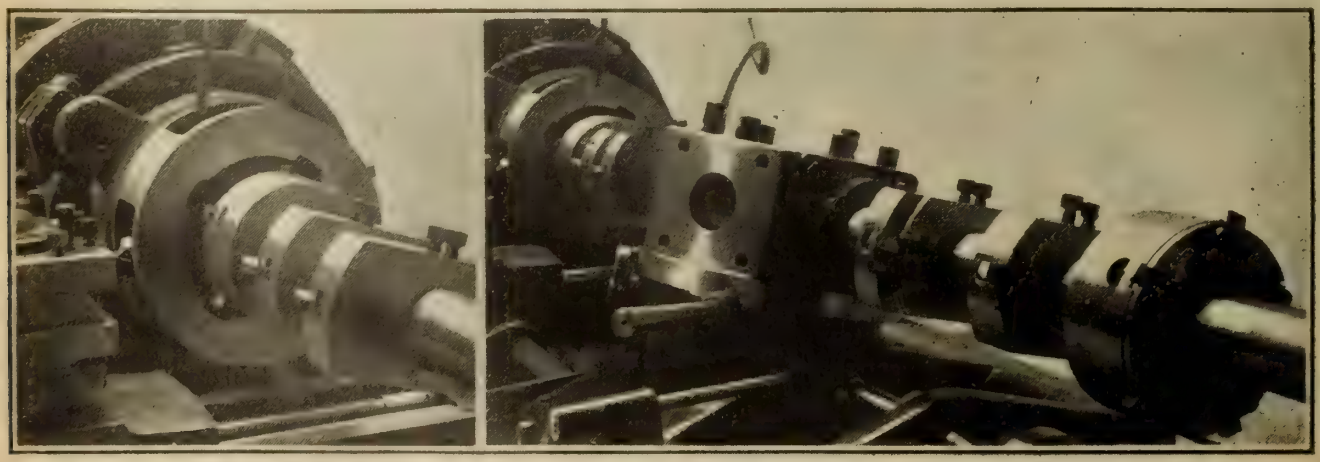

FIG. 13. SPECIAL FIXTURE FOR HOLDING THE WORK.

FIG. 14.—FIXTURE AND MULTIPLE TOOL HEAD USED ON SUCH WORK.

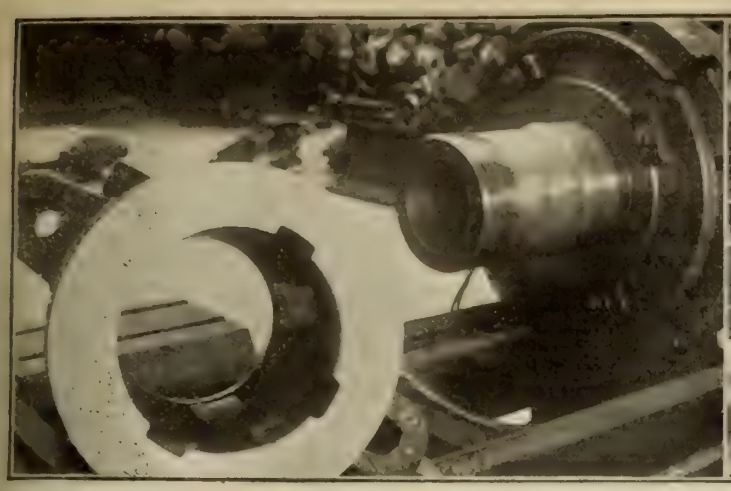

FIG. 15. METHOD OF HOLDING PIECE DURING SECOND OPERATION.

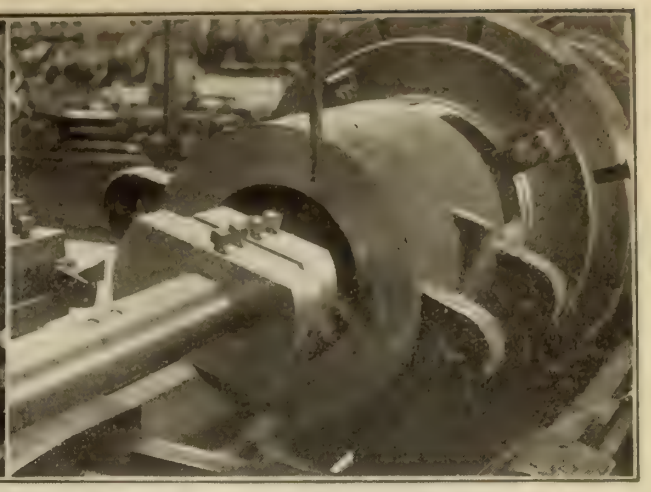

FIG. 16. NOTE THAT THE CASTING IS CLAMPED IN POSITION ON THE CHUCK PLATE.

This operation consists of facing the end of the casting with the tool held in the toolpost, also boring and counterboring the piece at the end by means of a double head boring bar as shown at Fig. 16. As these operations are self-explanatory we need not dwell on the same. Sufficient to say that the total time for both operations is 70 minutes.

This completes the present article, but in a later issue we will present further examples of good turret lathe practice.

## STANDARDIZING JIG DESIGN

Continued from page 37

costly one. Another point is this: Through lack of shop knowledge, some tools are designed which are difficult to machine. Some weak points in design are often apparent, which could be easily remedied if the designer possessed the required knowledge. I well recall seeing a jig which had been made with small pins for the feet, these being of such a size that they were constantly dropping into the slots of the vertical drilling machine table.

In order to meet emergencies such as I have briefly outlined, we recently designed a set of jig bodies, six of which are illustrated at Fig. 1. It will be seen that these tools may be used on six surfaces, the four sides, top and bottom. Wide bearing surfaces are provided, these being of a cross section so that the tool cannot foul in the slots of the table. The sides are cast low, so that chips may be easily removed, and the various bosses are raised so that machining is easily and conveniently performed.

A number of these various jig bodies are carried in stock, and when a jig is to be designed the draftsman lays out the outline of the jig body, taking the size most convenient. The various screws, straps, etc., are shown in position, and their correct locations determined. After the design has been duly finished and checked, it is sent to the tool room in the usual manner. All the various standard parts used on the tool are called for, any special part as straps being detailed separately on the drawing. The jig bodies are designated by number, as "stock body No. 4," and so on.

The tool maker, therefore, goes to the tool room stores and asks for the jig body casting at the same time that he calls for standard parts used. He is then in a position to make up the tool quickly, without inconvenient waits for either the pattern or casting. A further advantage is that the tool maker gets accustomed to machining this type of jig, and knows how to do the various operations to the best advantage, which is also true regarding the manipulation of the tool in service. We do not require a man to go around the shop to illustrate to the operators the correct method of using various types of tools, as this style can be adapted to a large variety of parts. The design is good in principle, the pattern can be cheaply made, castings are easily produced, and the tool room operations are simplified.

## THREE ESSENTIALS

There are three important and essential characteristics which coke for metallurgical purposes must possess, says the Chemical Trade Journal. First, it must be hard and resistant to the abrasive forces to which it is subjected in the course of its transport from the coke oven to the foundry, and it must be able to withstand the crushing strains arising from the weight of the superincumbent charge in the furnace.

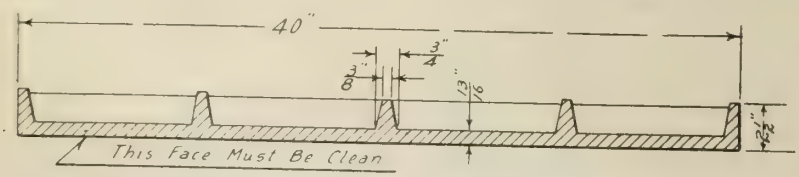
Second, it must contain a low proportion of ash, sulphur, and phosphorus—the limiting values demanded under normal conditions by many ironmasters are: ash, 10 per cent.; sulphur, 1 per cent.; phosphorus, 0.05 per cent.

Third, as the coke in certain zones of the blast-furnace reacts with an upcoming stream of carbon dioxide, it is an essential to the smooth working of the furnace that the coke possess a certain porosity, in order that a large surface may be exposed for interaction with the gas.

## NEW TYPE FURNACE

A rather novel type of electric furnace has recently been introduced in America. This furnace is known as the Von Schlegell repelling arc type, and two electrodes are suspended in the furnace chamber, being drawn together nearest the hearth by adjustable weights. As soon as current flows the repulsion between the electrodes forces the two ends apart, thus drawing out the arc. The repulsive forces also drive the arc down towards the charge. The electrodes being approximately parallel when in the operating position, the relative position of their ends is not affected by the wearing of the electrodes, or the melting down of materials. It would appear that all other changes are immediately compensated for by the fact that every decrease in current allows the ends of the electrodes to come closer together, and if any influence should break the arc, it immediately re-establishes itself. Unusual smoothness of operation is, of course, the chief claim. Three of these furnaces are being used in melting non-ferrous metals, and one is employed in the production of aluminium steel.

A project to bring coal from the anthracite regions in Pennsylvania to New York through two 14-inch pipes, by water pressure, is being considered by the city Dock and Health Commissioners. This seemingly wild plan was submitted by Mr. Reginald P. Bolton, a member of the American Society of Mechanical Engineers. Mr. Bolton explained that between Scranton, Pa., and New York there is a fall in elevation of about 2,000 feet, and that it would be as easy to transport coal in this fashion as by water. He estimates that 7,000,000 tons of coal, which would amply supply the city's needs, could be brought through the pipes every year.



The general contract for erection of repair shop for Pease Foundry Co., Lyon Street, Ottawa, has been awarded to J. Walker, 151 Strathcona Avenue.

# Points in the Production of Surface Plates

*By Donald A. Hampson, Member, A.S.M.E.*

AN EASTERN shop makes a great many special cast iron table tops, or surface plates, and the methods they have adopted are full of interest. A cross section is shown of a typical size which is 40" x 64". These plates are not as deeply ribbed as the surface plates used for scraping bearing surfaces —they have an average thickness of two inches and a rough casting of the size mentioned above weighs 650 lbs.—only about a quarter of what a machine tool surface plant of same area would weigh —this lack of metal has a direct effect on the casting all the way from the foundry to the packing room and calls for different handling on the planers.

Because the "face" of the plate must be clean, it must be cast down, which means that all of the sand forming the pockets between ribs must be suspended in the cope. Wood patterns are used, but these have metal "veneer" attached to a number of ribs to keep the patterns straight. Plenty of draft is allowed and one moulder is able to make a plate a day with such help as is required in turning and lifting flasks. Foundries doing this kind of work have to experiment to get results, just as a machine shop has to try out methods before getting into production. A good grade of pig must be used and this must be heated extremely hot to avoid cold shuts from the long distances the iron has to run in the thin flat bottom space of the mould. A most important phase of the work follows the pouring, i.e., the uncovering of the casting, which must be done a certain section at a time so that the cooling of the wide

SECTION OF SURFACE PLATE AS IT IS MOULDED.

flat solid part does not warp the whole, for the ribs themselves are relatively shallow and not strong enough alone to keep the piece straight.

### Inspection for Warp

Received in the shop, the first move is to inspect for an excess of warp—the foundry is apt to take a chance on a crooked plate that represents $50 on the bills and send it out though they know it is poor. Then the edges of the casting are cleaned, painted and filled. Two or three holes—depending on the size of the plate—are drilled in each end of the castings; these holes are for the clamps and are put in with an electric drill. The castings are now ready for the planer hand and when he is through they require only a coat of paint around the edges to make them ready for packing.

The foundry delivers all castings upside down for in that way they are ready to go on the planer for the first cut, which is over the bearing spots, and raised ¼-inch above the general level. After making the first cut, the casting is turned over, packed up roughly, and a good cut run over the face. "Packed up roughly" because there is no excuse for wasting time to "pack to 0.001" when the casting may spring a thirty-second after the skin is taken off the face.

### Re-packing

Following the rough cut, the clamps are loosened and the job re-packed with care, because there will be no subsequent structural change of any amount since the cuts will be light and over a comparatively level surface of clean metal. The castings always spring up in the centre, which is about the meanest way they could go from the standpoint of the man who has to get a piece of paper or tin in under that casting to support its centre against spring and chatter. And when a metal shim is successfully located there is no guarantee that it will stay put.

There are four or six of these "inland" bearing spots besides an equal or greater number around the outer edge—the spots are arranged in line so there will be a minimum of planing required. A scheme has been devised to avoid packing up in the centre: this is, to plane the centre spots first, then according to the size of the casting to lower the tool a sixteenth or a thirty-second, and cut the outer spots. Now, when a plate is turned over after the under side is cut, it rests hard on the centre spots while the edges are up, but the latter are outside and so get-at-able that it takes only five minutes to put in tin or paper shims. From that point, the finishing takes the usual form of cutting with flat and spring tools and may be carried on rapidly because there is excellent support even though the casting is relatively thin and light.

The method of handling the castings, while it would not appeal to the efficiency expert, has proven to be all that could be desired. Probably for this particular shop, it is more efficient than an overhead track system or one of the various types of cranes. The castings are bought outside and delivered by motor truck, two or three at a time. For the standard sizes, the weights run from 700 lbs. to 1100 pounds.

### Shop-made Trucks

Wooden trucks of skeleton design are made up of 2 x 3 maple with swivel casters on the four legs. The height of the trucks is the same as that of all the planers (which latter have been made alike). And this height is about the same as the motor truck body. This way there is very little lifting. The truckman is paid to deliver the castings in the shop and to carry them away crated from the shop. He is familiar with the shop facilities and does the loading and unloading with his own man unless he happens to be single handed, in which case he is loaned a boy or man for a few minutes. By placing a roller under the plate in his wagon and one on top of the shop truck that is to receive the plate, the latter is shifted very quickly. In fact, the change is made as quickly as a similar one to any other kind of handling device. Once on the truck, a boy can move the load to any part of the shop over the hard, smooth concrete floor.

These trucks are shop-made affairs, just for this one job. Besides the frame, there are half inch tie rods inserted top and bottom in both directions. Where the casters are fastened to the legs, a cast iron socket is used; this surrounds the post, extending up three inches, and makes a far more substantial construction than if the casters were fastened directly to the wood.

While a certain number of finished plates are kept on hand, the number shipped corresponds very nearly to the number received so that the necessity for some sort of live storage is evident —and this method is that of the trucks. The simple scheme of having the plates delivered flat side down makes it very easy to handle the plates on rollers, as well as delivers them the way the planer hands want them. Then after they are turned and finished on the flat side, they are shifted back on the trucks and there packed. The packing crates are standardized; the boards on top (the flat side) run across the plates, while those on the bottom run lengthwise—this latter makes the load as easy to put in the motor truck as it was to get out.

# Hardening and Grinding Milling Cutters

## Process of Hardening Equally Important As Quality of Steel—Care Should Be Taken in Heating—Grinding Wheels Must Be Kept Clean—Clearance Dependent Upon Material To Be Cut

*By F. H. Sweet*

IT IS NEEDLESS to say that the quality of steel used for the making of milling cutters is of great importance, yet the process of hardening is just as important, if not more so, than the quality of steel. Users of milling cutters will agree that a low grade of steel properly hardened and tempered will give better service than a high grade of steel poorly treated. But when both quality of steel and process of hardening and tempering are taken into consideration, a wonderful cutting wheel can be produced.

The methods of hardening, tempering and grinding milling cutters as set forth in this article may not be the best, but I have great confidence that anyone following the method will be quite successful and amply rewarded for the time spent in making the test.

A suitable place for hardening the cutters will be found in some rather dark corner in the shop. At any rate, the direct sunlight should be excluded from the room. The forge may be used for heating or, in case gas is handy, it is to be preferred. However, as many of the shops, especially the ones in the smaller places, have only the common forge for heating, I will consider the forge here.

Preparing the cutter for the hardening process is the first important step. In case it has blind holes or sharp angles, they should be protected with clay. Should there be a weak place which would be liable to crack in quenching, the better plan would be to protect it with asbestos. This asbestos will keep the part soft, allowing a greater expansion and contraction, and many times it saves a very valuable cutter from the junk pile.

### Heat With Care

In heating the cutter, use every precaution to heat it slowly and evenly, or some part of it may be ruined before the heat has been well started. In case the heat has been applied slowly and evenly, a cutter may be heated even without serious damage, although the proper heat is much better. If the cutter is heated unevenly or overheated, there is danger of cracking it in quenching. Many times the teeth will crack and part company with the body of the cutter.

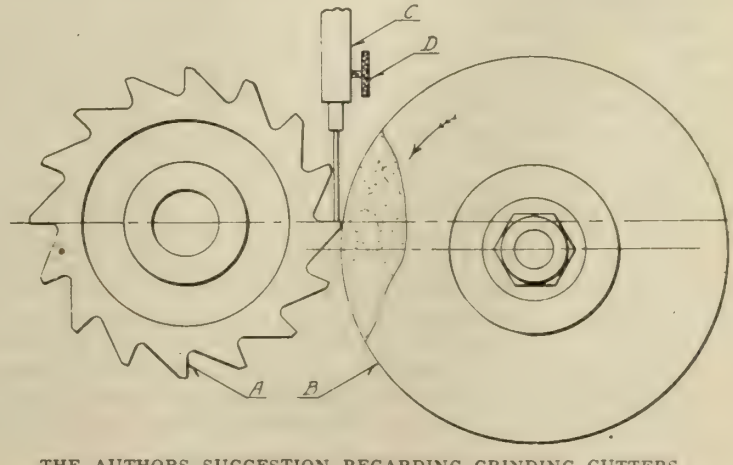
In case a mistake is made in heating, a very good plan is to remove the cutter from the fire and place it to one side. Cover it with finely burned ashes and allow it to cool very slowly. After this, the operation of heating may be repeated.

Large cutters must be handled differently from the small ones; that is, more care must be taken to get a fire that will accommodate the larger one in a uniform manner. Make the fire good and deep in the forge, with plenty of good, well-coked coal as a foundation, and bank the sides well up with fresh coal. Now make a bed in the live coals of the proper size to accommodate the cutter and place it flat and even in the coals, being careful that the air blast will strike evenly under the cutter.

Begin to heat slowly until a uniform red commences to show over the entire cutter, then place some slats or boards about ¾ to 1 inch thick under the cutter. Use the air blast lightly until a bed of live coals is again under the cutter. Turn the cutter again and place a fresh supply of pine slabs under it. The chances are, unless the cutter is very heavy, that a couple of applications of pine slabs will be sufficient, but in case more heat is necessary, continue to use the slabs, each time turning the cutter over. When the cutter has been heated evenly to about the desired heat, continue a little longer so that the heat may be on the rise at the time of quenching.

Remove the cutter from the fire and place in the brine bath, leaving it in the bath for about one minute, after which take it from the brine and put it into a bath of oil, allowing it to remain there until it is entirely cold. The hardening of the cutter is, without doubt, the most particular of any operation entering into the making of milling cutters.

### The Right and Wrong Method



The plunging or quenching is a very simple operation, but there is a right and a wrong way of doing it. Should the cutter be a thin one, the best plan will be to dip it vertically, for the simple reason that if it were applied flat side down the lower side would naturally be cooled the faster and the cutter would have a tendency to cut or warp, so to speak. Although this might be to a very small extent, the cutter might be rendered absolutely useless, so far as answering the purpose for which it was made.

In case we are to dip or plunge a cutter with a long hole, the better plan is to dip it with the hole vertical, allowing the water to circulate freely in the hole. There are special cutters with large recesses, and these should be dipped with the recess up. If they were dipped with the recesses down, steam would be formed and prevent the water from coming in contact with the cutter. This might result in a crack or hard and soft spots in the region of the recesses.

One important rule to be remembered is to cool symmetrical parts simultaneously and let the water have free access to every part of the cutter as nearly at the same time as is possible. Should one prefer, the cutter may be cooled sufficiently so that no color will show at the cutting edge if the cutter is polished immediately.

The large cutters may be removed from the bath just as soon as the cutting teeth are hardened. In a very few minutes the heat in the body of the cutter begins to run out to the teeth, but just before it reaches the teeth the cutter should be again plunged for about a second. This may be repeated three or more times, according to the size of the cutters.

When at last they are cold, they should be put back into the fire and maintained for three or four minutes at a heat sufficient to show color—a very light straw—and let it cool in the air, not draft. The teeth should be as hard

THE AUTHORS SUGGESTION REGARDING GRINDING CUTTERS

as a new file, in fact, they should be hard enough to scratch glass.

One of the first considerations for sharpening milling cutters is the grinding wheel. The grinding wheel should be neither too coarse nor over fine. A coarse grade of wheel, sufficiently hard so that when in use the emery will not fly, is found to be the best suited for most classes of work and less liable to draw the temper of the milling cutter.

### Keep Wheels Clean

The grinding wheel should be kept clean, as a wheel with a dirty or gummy surface will not cut well and will have a tendency to draw the temper from the cutting edge. A gummy, dirty wheel also has a tendency to cut and gouge, leaving a very irregular surface. There are a number of methods employed for cleaning the grinding wheels, but the methods which follow I have found to be very satisfactory.

In case the face of the wheel is gummy, dirty or irregular, the diamond truing tool will be found the most satisfactory, for it not only removes the dirt, but trues the face of the wheel as well.

Should the side of the wheel be dirty and irregular, a very good plan is to sprinkle coarse emery upon the surface plate and rub the surface of the wheel lightly. This will remove the dirt and gum from the wheel, leaving the sharp particles of emery projecting free to cut. In the event of the cutting wheel drawing the temper from the cutter after it is thoroughly cleaned, reduce the cut until the heating is stopped, even though it is necessary to make two or three cuts to get the cutting edge sharp.

In grinding milling cutters or reamers, it is better to plan to run the wheel the entire length of the cut and pass off at the end before setting the cutter for the second cut, as this will eliminate the danger of gouging or scoring the cutter at the extreme outer ends. Much care should be exercised in keeping all bearings and joints tight so that there will be no variation in grinding the different cutting edges of the milling cutter. Cutters should be kept sharp at all times, for a cutter that is kept sharpened will outwear one that is dull and drags, pushing rather than cutting the metal away.

When possible, or rather practicable, it is better to grind cutters with the emery wheel running onto the outer edge, as it secures a finer cutting edge on the tooth. The central axis of the grinding wheel, B, is slightly lower than that of the milling cutter, A. To make sure that the cutting edge will have a clearance and pass freely from one cut to the other is a matter of importance. This, as a matter of fact, can be controlled to a large extent by the adjustable guide shown at C, having a movable leg, E, held in position by locking nut D. By shortening leg E, the cutter may be revolved on its axis, giving more or less clearance, as desired.

*POINTS BROUGHT OUT*

*That a low-grade steel properly hardened and tempered, will give better service than a high-grade steel poorly treated.*

*That direct sunlight should be excluded from the hardening room.*

*That weak parts should be protected with clay or asbestos, thus lessening the size of the scrap heap.*

*Heat cutters slowly and uniformly. It's another case of the more hurry the less speed.*

*That the piece can be ruined in quenching. Be sure to study the nature of the piece, for there is always a right and a wrong method.*

*Cool symmetrical parts simultaneously. Let the water have free access to all parts of the cutter at the same time if possible.*

### Amount of Clearance

The necessary amount of clearance must be decided by the material to be cut, especially in the grinding of reamers to be used on brass, which for free and easy cutting should have a clearance of five to ten degrees. Should we use a reamer on brass with a greater degree of clearance, it will be liable to chatter and leave a wall rough and pitted.

Steel and cast iron to be faced with the milling cutters should first have the scale removed and the cutters ground with the proper clearance. From about five to twelve degrees rake will be found best for materials of this kind. The clearance will vary from three to eight, any many times to even ten degrees, depending upon the hardness of the material cut.

Should there be a tendency to chatter, the cutting edge of the cutter should be treated with the oilstone until the chattering is stopped. Chattering is nothing but the cutting edges biting and letting go in rapid succession. There are times on special jobs of very broad work where it is necessary to grind the cutters so as to remove the rake entirely, allowing the cutter to drag in order to prevent chattering. In nearly every instance, especially on broad heavy work, place the cutter ahead of the centre, slightly exposing a larger cutting edge to the work.

When using multiple cutters, a better plan is to space them unevenly, giving the cutting the "staggering" effect, thus preventing chattering. The nearer the chuck or centre the cutter can be placed, the less liable it is to chatter and the smoother it seems to cut.

As a rule, the angle-clearance on all tools of this kind must be more than the spiral generated by feed at the smallest diameter of the cutting points plus a sufficient clearance to be really forced to the work below the cutter, which is very close to three degrees.

The angle-clearance may be varied by "stoning" to prevent chattering in case it is necessary, but it hardly will be necessary under ordinary circumstances.

## RULES FOR HANDLING DIE BLOCKS

The following rules for the handling of die blocks are given by the Pennsylvania Forge Co., Bridesburg, Philadelphia, Pa., in a recent publication entitled "Die Blocks":

1. Never harden a block unless the impression has been carefully polished. Rough impressions are the cause of many failures.

2. Never charge cold blocks into a hot furnace.

3. Never rush heating operations. Take plenty of time and save trouble.

4. Never quench a block that shows uneven heating. If properly "soaked," the color and temperature will be the same throughout.

5. Never allow a block to become dead cold in the bath.

6. Never postpone the drawing of a die block. Draw it immediately after hardening.

7. Drop-forging dies should never be stored in a cold, draughty place after hardening.

As the result of an examination by the American Bureau of Standards of a large number of specimens of the steel deposited in electrically arc-welded joints it is stated that this metal has mechanical properties like those of an inferior casting. In tension tests the metal showed low ductility, and all of the specimens examined—about seventy in all—showed evidence of unsoundness in their structure, tiny inclosed cavities, oxide inclusions, and lack of intimate union. The conclusions reached are that this unsoundness is a necesary consequence of the method of fusion as now practised, and that it is responsible for the deficiency in ductility of the joint metal. Both a "pure iron" electrode and a low carbon steel electrode were used, with practically equal results. The composition of the material changed in fusion by elimination of carbon and other elements. The use of slight protective coatings on the electrodes did not appear to affect the mechanical properties of the arc-fused metal.

The Swiss Government, which has been exploring for iron-ore deposits for several years, has made a real find in the Frick valley. According to a contemporary, some 15,000,000 tons have been estimated, with less than half of the deposit explored. A furnace plant is to be established with the State as part owner. Electrical smelting will be employed, with a saving, it is anticipated, of nearly three-fourths of the coke burnt in ordinary furnaces.

# Have You Tried This Contest Yet? If not--- Do so Now

Below will be found twelve references to advertisements in this number. To the sender of the first correct set of answers to these we will forward one of these scales.
To win one is not difficult, and at the same time you will add to your store of knowledge. Read the details given below.

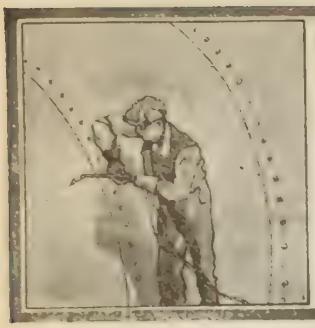
The scale is 6 in. long and is made from finest quality steel. One side is marked in 32nds, the other side in 64ths. A table of decimal equivalents is also stamped on one side, and a table of tap drill sizes on the reverse side. This scale is well worth securing.

## What You Have to Do

We publish every week a number of interesting facts or statements selected from the advertising pages for that week. The selections for this issue are given below. Read these through, then turn to the advertising section and see if you can pick out the advertisements to which they refer. The work is interesting, it will train your powers of perception and of memory, it costs you nothing, it will make you better acquainted with the various lines of machinery and tools in the market, and with perseverance you are bound to win one of these useful scales as a prize.

Four contestants had correct lists for the Feb. 3rd issue and we had to resort to the elimination process as described in the Feb. 10th issue before a winner could be announced. Harold Baird, Windsor, N.S., was the lucky one, and Clarence Welsh, Port Hope, George Todd, Penetanguishene, and Wallace A. Powers were the second, third and fourth in place. The interest in this contest is keen, and we request that readers send their answers in as early as possible.

**CONTEST FOR FEBRUARY 24TH ISSUE**



**Contestants are required to write us, stating to which advertisements we refer in this number.**

1—Something that is easy to instal.
2—How to get away from leaky joints.
3—An emphatic statement.
4—Something that should not be lightly considered.
5—How to solve the temperature problem.
6—A reasonable request.
7—Three features of importance on a certain tool.
8—Something that means a serious loss if not watched.
9—A product said to develop maximum power.
10—Something new.
11—Something that obviates heavy freight charges.
12—How to obtain full capacity plant operation.

**These are Correct Answers for List from February 3rd Issue:**

1—Canadian Ingersoll Rand Co.
2—Heald Machine Co.
3—Dominion Rubber System.
4—Rockford Milling Machine Co.
5—E. C. Atkins & Co.
6—The Standard Optical Co.
7—Kearney & Trecker Co.
8—Photostat Corporation.
9—Modern Tool Co.
10—Oliver Machinery Co.
11—Fellows Gear Shaper Co.
12—The Acme Machinery Co.

## Closing Date for This Contest is March 17th.

# WELDING AND CUTTING

## Hints on Oxy-Acetylene Welding and Cutting

### Preparation for Welding—Different Styles of Joints—Examples of Work Performed—Preheating, Reheating and Annealing—Welding Rods Used.

A BOOKLET recently issued by the Oxweld Acetylene Co., Newark, N.J., embodies some helpful instructions in the art of welding which, as they will doubtless prove of interest to our readers, we have secured the privilege of reproducing. The first subjects to be dealt with are proper preparation for welding, reheating, preheating, and annealing and manipulation of blowpipe.

The operator should remember that any job to be welded must be properly prepared, cleaned, lined up, etc., before the blowpipe is lighted. Metals of ⅛ in. in thickness or less are usually butt welded without bevelling, while in welding metal parts more than ⅛ inch in thickness the entire thickness of each side should be bevelled at an angle to give a groove between the edges of from 60 to 90 degrees. Bevelling insures penetration of the weld entirely through the metal. This is especially necessary in heavy sections. When the metal is more than ¾ inch thick and it is possible to weld from both sides it is sometimes advisable to bevel as illustrated by Fig. 6.

For work exceeding ¾ inch in thickness, the bevelling operation, in the case of steel, can be performed by means of the oxy-acetylene cutting blowpipe. On thinner sections, the bevelling can be performed by grinding, or with a hammer and chisel. On the thinnest sections where bevelling is necessary, use a file.

In construction work, on extremely thin sheet metal sections the edges of the parts to be welded should be flanged as shown at Fig. 4. When this is done, no filling material need be used, the metal in the flange serving this purpose. Fig. 5 shows the appearance of a weld made on thin sheets, flanged before welding. Fig. 7 shows a type of clamp that can be used to advantage on thin metal sheets flanged for welding. It can be operated by a helper, who grips the metal a few inches ahead of the weld and moves the clamp when the welder comes up to him. On long seams a number of these clamps can be used, being held in position by the locking ring which is shown around the handle.

The lap weld shown under Fig. 6 has some disadvantages and should only be attempted when butt welding or flange welding is impossible. The weld does not penetrate the total overlap of the parts and is therefore of uncertain strength.

In all welding operations, the parts to be welded should be set in proper alignment before the flame is applied. Too often, operators fail to take enough time at the start to properly line up the parts to be welded. The result is that the work is sometimes found to be out of alignment and the part rendered useless, no matter how good a weld has been made.

Fig. 7.—Method of holding flanged sheets in position for welding.

It is always advisable to have on hand a good supply of different size clamps, "V" blocks and mandrels. These are always useful in setting up various jobs, as shown at Figs. 8 to 11. The inexperienced operator will find it a big help to build a form of fire clay as a support for the broken sections while repairing thin castings. This holds the parts true and also assists in the control of the molten metal.

Whenever it is necessary to weld in a patch, a new piece of the same metal should be cut to the proper size and shape, the edges of both parts bevelled, and the patch held in place temporarily by "tacking," that is, welding at several spots some distance apart along the line to be welded. To hold a large patch in position while being "tacked," it may sometimes be necessary to drill a small hole in the center of the patch into which a length of rod can be inserted, and by which the patch may be handled. This hole may afterward be plugged and welded up. Small patches, to be placed in difficult positions, may be conveniently handled by simply welding a welding rod to the center of the patch. This may later be melted off. All metal should be thoroughly free from grease, oil, dirt, rust and scale in the neighborhood of the weld before the welding flame is applied.

#### Expansion and Contraction

In every case of welding, internal strains are inevitably set up due to expansion when heating and contraction when cooling. When parts being welded form part of a structure and are not free to move during the welding process, the strains produced may cause the metal to crack. This is especially true of cast iron. If the cooling after welding is rapid or irregular, the tendency to crack will be greatly increased. Whenever local strains due to expansion or contraction exceed the strength of the metal a fracture must occur. To relieve internal expansion and contraction strains, caused by the intense heat of the welding flame and subsequent rapid cooling, it is desirable to preheat the whole piece before welding, sometimes heat it during welding, and then to reheat it after the welding is completed. In the case of a

Lower Center.—Flange joint for thin sheets before welding.
Fig. 6—Upper right.—Bevel and weld for very heavy sections.
Lower Right.—Lap joint that should not be used.

Figs. 8 to 11 inclusive. Upper left, shows lower section of aluminum crank case clamped to angle iron to insure alignment. Patch is shown ready for welding. The other views also illustrate methods of ensuring proper alignment.

restrained section of a cast iron part, this treatment is imperative—the heating should be carried on slowly and the work kept as free from air draughts as possible. This treatment is not always essential for steel but can never be anything but beneficial.

**Preheating, Reheating and Annealing**

In order to economize in the consumption of acetylene and oxygen it is often desirable to heat the work to be welded as much as possible before the welding flame is applied. In the case of small castings the preheating of the whole piece is generally essential, not merely from an economical point of view, but in order to bring it to a uniform heat and thus insure a uniform contraction while cooling is taking place after the weld is made. In some cases to obtain this result it is necessary after preheating and welding to reheat the piece in order to equalize the temperature (which is naturally highest along the line of weld). This insures uniform contraction and freedom from internal strain.

Welds in steel or iron plates where preheating is not necessary will always be improved if annealing is done along the line of weld. For these operations various sources of heat can be employed. Illuminating gas used in conjunction with air can often be used to advantage. A simple gas torch to do this can be easily constructed from ordinary gas pipe, as shown in Fig. 12. The lower pipe supplies the illuminating gas and

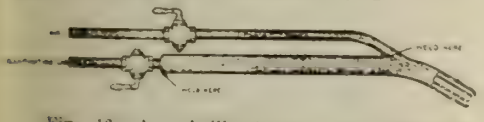

Fig. 12.—An air-illuminating gas preheating torch.

the upper pipe supplies the air, delivered at about two pounds pressure. For the air supply a small blower is quite suitable and inexpensive.

On many occasions oil can be used as a source of auxiliary heat with very good results, and in a wide range of conditions is probably the most economical one to employ.

A coke or charcoal fire is excellent for preheating if the size of the casting renders heating by a torch impractical. Charcoal is better than coke, since it gives a clean fire of about the right temperature and leaves little or no ash. Once started, charcoal burns readily with a small draft. If coke is used, care must be taken to see that the work is not allowed to become overheated and burned. An ordinary blacksmith's forge may be used for heating parts when no other method is available, but great care must be taken to see that the work is not burned, due to overheating on one side.

Preheating preferably should be done in a brick furnace. A picture of a fire-

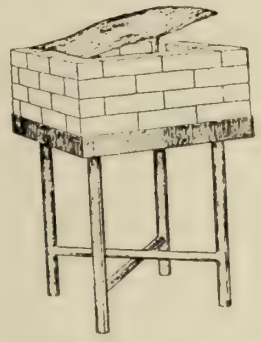

Fig. 14.—Fire brick preheating furnace mounted on small welding table.

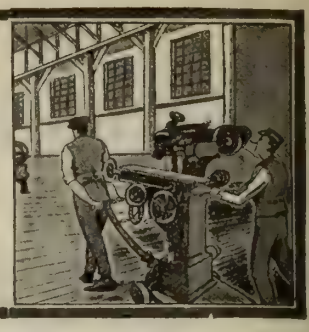
brick furnace mounted on a welding table is shown in Fig. 14. The table is built up of gas pipe and sheet metal, welded where necessary. The top is covered with fire brick. Loose fire bricks are used to form the sides of the furnace; these may be arranged in any form to suit the particular job. The top of the furnace consists of a loose piece of sheet iron. A hole for the preheating torch may be left in the side. After the casting has been brought to a dull red heat, the cover is removed and the weld made. After welding, the casting again should be brought to a dull red heat all over and allowed to cool gradually. After this final reheating, all holes in the furnace should be plugged up with fire clay or asbestos to keep the heat in. If it is impossible to do this, then it is advisable to cover the casting entirely with lime, sand or charcoal to keep the air away from it.

Where conditions justify it, a small muffle furnace may be employed. The part being welded is placed on a small car which operates on a track leading into the furnace. Then, if the casting cools before the weld is finished, it may be shoved back into the furnace and brought to the proper temperature before the weld is completed. Something of this kind is very convenient where a number of castings of approximately the same size and shape are to be repaired. It is advisable to provide the operator with a pair of large gauntlets, preferably of asbestos, or other protective material, to protect his hands and wrists from the heat.

**Welding Rods**



The gap, or crack, that exists between two pieces prepared for welding requires that some additional metal be supplied to fill it up. For this purpose rods or wires known as welding rods of various styles are employed. It will be appreciated that the strength and nature of the welded joint will depend to a great extent on the nature of the filling rod. In order to obtain a joint that will be the same as the metal of the parts being welded it is of course necessary that the added metal after the welding is completed be of the same percentage composition. In order to obtain this ideal result it is often necessary that the rod before it is melted into the gap or crack, contain some excess of the substances (foreign to the pure metal) which give to the sections of the metal part to be joined their particular characteristics of hardness, ductility, or high tensile strength. The necessity at times for adding an additional quantity of this particular quality giving substance is due to the fact that a portion of this substance may be burned out (or volatilized) during the welding. As an example take the case of 0.20 per cent. (20 point) carbon steel—if it was desired to have a welded joint with the carbon content the same, it would probably be best to use a rod that had 0.35 per cent. (35 point) carbon content, and then a good deal would depend on the speed at which the work was performed and the skill of the operator.

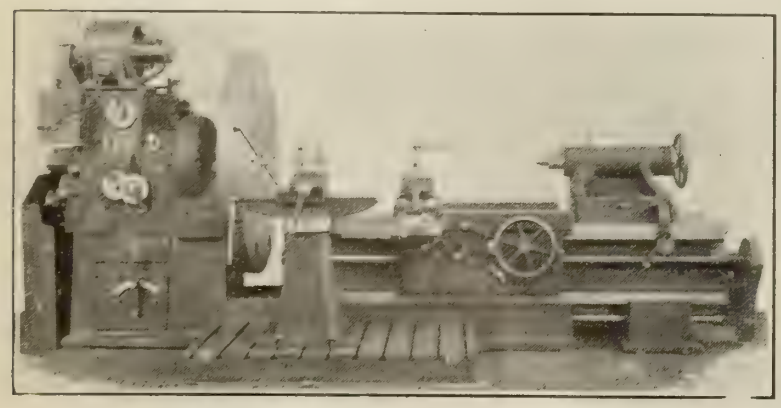
Fortunately such ideal results are not often necessary in practice and the employment of good rods supplied by firms of repute will give joints that are of such a nature that they will stand the stress and wear of use. For some classes of welding work it is necessary that the rod contain some foreign substance that is not in the metal to be welded in appreciable quantities, in order to help counteract the tendency to oxidize or assist in making the molten metal flow evenly. As an example, take the case of rod employed for welding grey cast iron. This must containe 3 to 4 per cent. of silicon to act as a deoxidizer and also assist in the prevention of formation of white iron. In most cases these difficulties are overcome by the use of a flux.

To be continued

# DEVELOPMENTS IN SHOP EQUIPMENT

## MOTOR DRIVEN BREAK LATHE

The Canada Machinery Corporation, Ltd., Galt, Ont., recently shipped a rather interesting 74 in. x 10 ft. motor driven break lathe to China. This machine is to be used in one of the large Chinese railroad shops and the illustration shows the general appearance.



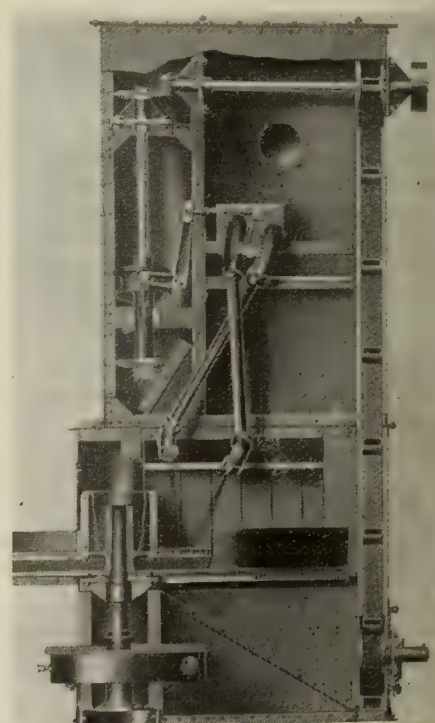
Probably the most interesting part of this lathe is the head which is their standard 27 speed design. 18 of these speeds are obtained through the spindle and 9 through internal gear on the face plate, thus giving a large range of speeds suitable for any class of work. The speed changes are all readily obtained by levers located on the head of machine, the motor being mounted directly on top and driving to head by means of steel and rawhide gears. A friction clutch is mounted in this gearing for convenience in starting and stopping. Due to an interlocking arrangement of the gear changes it is impossible for any two conflicting combination of gears to be meshed together with consequent damage to the machine.

The bed is deep and braced with cross ribs of box section, being provided with three large inverted V's, and while the tailstock rests on one V and one flat surface, the saddle bears on two V's and also on the flat surface. The bed moves on the base by means of a rack and pinion which is operated by a wrench at rear of machine, and is clamped in place by bolts, which fit the tee slots in the base. It is alsc supported by a box leg in order to eliminate any strain from overhang when at its extreme length.

The base is of massive construction and ample weight to support the bed and headstock. It is provided with a planed slot fitting the rack in the bed which acts as a tongue and insures alignment in any position. The extended portion of the base is slotted in order that the pedestal tool post may be placed in any position.

The spindle is turned from special high carbon steel and has a hole bored from the solid through its entire length. On the nose is milled an Acme thread to receive face plates. The gears in the apron are steel, and in order to facilitate the movement of the saddle the hand wheel is not geared directly to the rack in the bed, but indirectly through a reducing intermediate gear. The rack pinion is drawn out of mesh by a knob handle on the end of the pinion stud, when the machine is used for screw cutting. In order to obviate the necessity of reversing the lathe when screw cutting, a thread chasing dial for indicating the correct point for engaging the nut is provided on the carriage.

A compound tool rest on the saddle is provided, as well as a compound pillar rest with English tool post mounted on the extended base. The upper portion of this tool post is pivoted and is graduated so that it may be swung round to any angle. It is subject to variable longitudinal feeding by means of an overhead rocking shaft operated from a lever on the headstock. The tailstock is clamped to the bed by four bolts and is also braced by a pawl engaging in a rack cast solid in the bed in order to relieve the strain when doing heavy work. It may be set over to turn tapers, the base being graduated for this purpose. The lathe weighs approximately 30,000 lbs.



GENERAL VIEW OF THE LATHE

## SAND BLASTING MACHINES

The Pangborn Corporation, Hagerstown, Md., have placed on the market a line of rotary automatic table sand blasting machines. These machines are made in five sizes, and have three different systems of blasting action.

For the larger character of work the direct pressure system is used with the blasting action supplied by a direct pressure hose blast and equipped with elevator and separator, using both mechanical and exhaust means for reclamation and separation of the abrasive. The reclaimed abrasive is accumulated in storage bins from which the hose blast is instantly refilled through a quick acting valve, that makes the operation practically continuous. This machine is made in two sizes, with table 70 inches and 90 inches in diameter, with clearance of 15 inches between the table top and nozzles. Oscillating nozzles (see Fig. 1) cover the entire surface of the blasting zone which is entirely enclosed.

For work less difficult to clean, or where the intensive action of the direct pressure is unnecessary the gravity feed type of machine is equally efficient and permits of an entirely self-contained machine. Mechanical and exhaust action is

SECTIONAL VIEW OF BLASTING MACHINE.

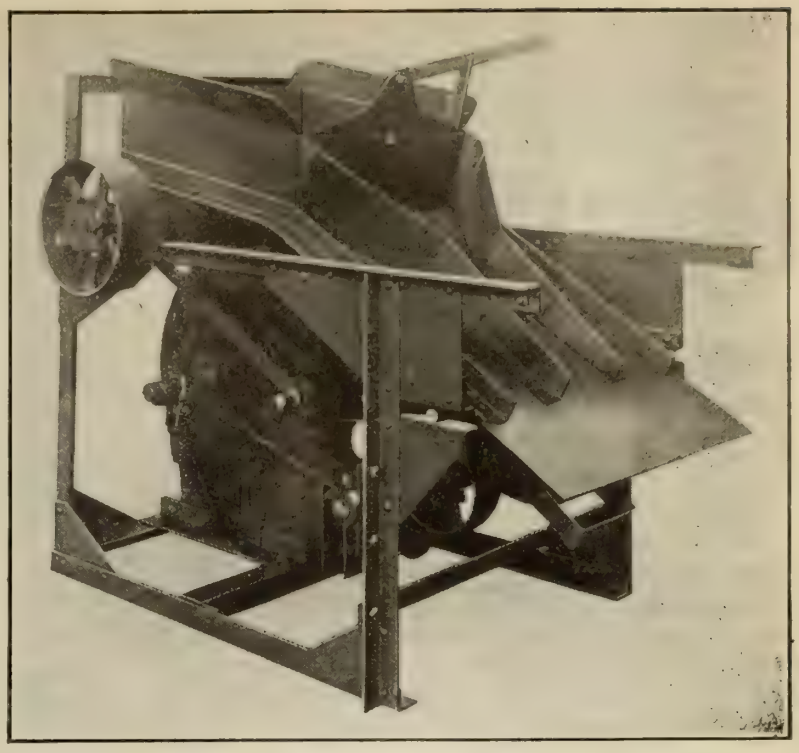
used for reclamation and handling of the abrasive which is fed by gravity in a continuous cycle to the nozzles, where the full force of the air is exerted to the propulsion of the abrasive. This machine, though made in but one size with table diameter of 84 inches, has an adjustment of the nozzle arms that permits a clearance of 10 inches or 15 inches between the table top and the nozzles, making it applicable to the widest range of work. Like the direct pressure the blasting action is entirely confined and movement of the nozzles covers every portion of the work within the closed zone.

For the cleaning of lighter work and requirements of refinishing, etc., a self-contained suction feed type is made.

The used abrasive is reclaimed through screens and the handling is without elevator use. The cleaned abrasive is carried continuously by suction or syphon to the nozzles.

This table is made in two sizes, a 42-inch diameter table with one nozzle with vertical adjustment allowing any distance from 5 inches to 12 inches between the table top and the nozzles.

The larger size of these machines has a table diameter of 70 inches with clearance of 12 inches between the nozzles and table top allowing for reasonably large work or a large quantity of small pieces. Like the other models the blasting action is entirely confined and the nozzle movement covers the full area of the blasting chamber.



## PNEUMATIC CHIP SEPARATOR

The pneumatic chip separator shown in the accompanying illustration has been placed on the market by the Ideal Concrete Machinery Co., Colerain Ave., Cincinnati, Ohio, for use in separating chips from screw machine products and work of a similar nature. It is claimed that by the use of this machine one operator can handle as much work as three men using riddles, or as much as six men picking by hand.

The work and chips are placed in the hopper of the separator as they come from the machines. The hopper and the inclined slide which is attached to it have a compound vibratory motion. When the gate at the front of the hopper is opened, the vibratory motion causes the work and chips to slide down over the inclined slide. A properly located opening in the slide permits the work to drop into a tote box or pan, while the chips are passed over the opening by means of an air draft from the fan so that they fall off the end of the slide.

The distinctive feature in the operation of this machine is as follows: The compound vibratory motion which spreads out the work and chips as they come down the slide permits a light air draft from the fan to float the chips over an opening in the slide through which the work drops; this method of separating the chips requires a much lighter air draft than would be needed if the chips were blown up into the air, and at the same time effects a satisfactory separation of chips from small as well as large work. In addition, the work does not at any time pass through enclosed passages, a feature which renders it practically impossible to clog the machine by overloading.

The frame of the machine is constructed of angle iron, hot-riveted, and reinforced at the corners with heavy gusset plates. The bearings are lubricated by grease cups and sight-feed oil-cups.

GENERAL VIEW OF THE CHIP SEPARATOR.

## CYLINDER-GRINDING MACHINE

A grinding machine, constructed on the knee-type design, and especially adapted for general repair work, has recently been placed on the market by the Heald Machine Company, of Worcester, Mass. This machine is primarily intended for repair work on automobile engines but its construction makes it highly suitable for all-round work. The size of the table is sufficient to provide plenty of range for large work without excessive overhang. The table travel is adjustable and automatically reversed. The wheel spindle is hardened and ground with solid taper bronze bearing at the front end and self-aligning ball bearing at the rear. Interchangeable pulleys are provided for varying the speed of the wheel spindle.

## PISTON-RING GRINDING MACHINE

An attachment for the automatic grinding of piston rings, for use on their standard rotary table machines, has been brought out by the Persons-Arter Machine Company, of Worcester, Mass. The piston rings are fed on and off the machine automatically, the device being operated by compressed air supplied from the ordinary air lines of the shop. The device consists of a plate containing six recesses for holding the rings, and these are located intermittently beneath the grinding wheel, and while in this position are given the necessary motion for the grinding of the ring. The air cylinder for operating the attachment is located beneath the work table.

## SPRING THREADING TOOL

A new design of spring threading tool has been placed on the market by the Ready Tool Company, of Bridgeport, Conn. The tool holder is of the goose neck type, and the cutter is made of high-speed steel and placed in the holder at an angle of 15 degrees with the vertical, the sides of the tool being ground to provide for the cutting of a 60-degree thread; only the top surface of the tool is ground when sharpening. Teeth are provided both in the tool bit and in the head of the clamping dog. Adjustment of tool resistance is provided for by the addition of a flat spring in the goose neck of the tool holder. The tool has a righ hand off-set and is made of ½ by 1-inch stock and 7 inches long.

The H. Mueller Mfg. Co., Ltd., Sarnia, Ont., are contemplating the erection of an iron foundry.

## The Use of Ball Bearings

DID you ever watch a lot of huskies heaving and tugging at a heavy load? There's a tremendous amount of energy expended in the stone-age method.

Then some chap takes a walk into the shop and brings out a couple of pipes for rollers. The rest is easy.

The rollers eliminate a good share of the friction, and the more this is done the greater the ease with which the load will move.

And yet there are plants that continue to run their power transmission largely on the idea of the plank on the road. The application of the principle of ball-bearings is so well established that it does not require argument.

The first article in this issue of Canadian Machinery deals with the usefulness of ball-bearings to industry, showing the development of the idea and the extent to which it has been applied to mechanical work. Further instalments will also appear and then again on March 17th the same matter will be taken up from another point, viz., "Direct Application of Ball Bearings to Various Machine Tools."

Shop executives would be well advised to file this material away for future reference. It may suggest some of your own problems and show you very definitely where ball-bearing installations will be your best way out.

## The Buyer in Control Now

THE buyer is in possession of the market now and he knows it. The good salesman is not going to object to this condition as long as the buyer is inclined to play the game square. The average salesman is keen for business and is ready to get down to brass tacks with any man who has business to place.

One dealer was giving his opinion of a certain purchasing agent this week and added, "He is certainly a hard buyer and when he gets his prices just now there is not much left in it for the dealer. But we know he means business when he asks for a quotation. We don't mind that sort of a man, because he is out to place some business in the market and it is his duty to his firm to get the best price he can. But we all know he is not just asking for prices to see how things stand. He buys hard, carefully, keenly—whatever you care to call it—but the big fact is that he buys and does not run away out of the market after getting the whole trade to give him quotations."

It is much better to study the market closely and then buy, than to simply stand on one side and wait until the whole market has adjusted itself to your liking.

## Standards of Practice

CANADIAN MACHINERY is a member of the Canadian National Newspapers' and Periodicals' Association. That bare announcement may mean little in itself, but readers and advertisers are entitled to know what this Association stands for in its practices. It is entirely for the benefit of these two, particularly the readers, that the following standards of practice have been formulated:

1. To consider first the interests of the subscriber.
2. To work for truth and honesty in all departments.
3. To eliminate, in so far as possible, their personal opinions from their news columns, but be leaders in thought in their editorial columns, and make their criticisms constructive.
4. To refuse to publish puffs, free reading notices, or paid write-ups, to keep their reading columns independent of advertising considerations, and to measure all news by the standard "Is it real news?"
5. To decline any advertisement which has a tendency to mislead, or which does not conform to business integrity.
6. To solicit subscriptions and advertising solely upon the merits of the publication.
7. To supply advertisers with full information regarding character and extent of circulation, including detailed circulation statements, subject to proper authentic verification.
8. To co-operate with all organizations and individuals engaged in creative advertising work.
9. To avoid unfair competition.
10. To determine what is the highest and largest function in the field which they serve, and then to strive, in every legitimate way, to promote that function.

We ask the assistance of readers and advertisers in living up to these standards. This paper seeks to serve its field well and is at all times open to suggestions as to how this can best be done.

—From L. P. Miller, Russellville, Tennessee.
**A RUSH ORDER**

# Gradual Improvement Has Been Noticed

FOR several weeks views have been appearing on this page tending to show that there is a gradual improvement in conditions. There has been no attempt made to exaggerate this improvement, neither has there been any move to cut out references that tended to show the conditions were not any more favorable.

There is a growing willingness on the part of manufacturers to give expression to their views on these matters and to pass along any helpful information they may possess.

"The improving condition is not such that it enables us to market cannot be said to have made much progress when compared to a week ago, although it is pretty hard to take it by weeks. But some of the firms were ready to admit that they had done a fairly good week's trading. Others saw improvement in the number of inquiries they had been receiving. Others had releases on orders that had been held up for some time. Not a great deal in any one place, but put together, quite a nice little showing in the aggregate.

Some machine tool dealers were interested in installations they had just completed in shops which had taken advantage of the dull season to improve their method of production. These plants are in good shape to go ahead now and they will be better able to produce than ever before.

### Better Than a Month Ago

Canadian Machinery asked Dominion Forge & Stamping Co., Ltd., at Walkerville, if there was anything that had come under their notice that would indicate an improvement in conditions, and B. W. Vallat, the president, has replied that conditions are better now than they were and he looks for the improvement to be continued. Mr. Vallat adds that "We want to do our bit in furnishing anything along this line that will be of help to you."

"In our own business," he says, "We are pleased to state that things look very much better than they did a month ago. We believe that things have taken a decided turn for the better and I believe this applies to the entire district.

"We feel especially encouraged over the fact that it is possible to figure our work on a more sound basis than we were ever able to do before. Raw materials are more stable and we can get deliveries within a reasonable time. Labor is more efficient and is giving much better results, so that it makes a very much more definite basis for figuring out our work for the present and future.

"To my mind if there is any one thing more than other that would encourage manufacturers at this time it would be an announcement on the Excess Profits Tax, which would tend to either greatly reduce or abolish it altogether for this year.

"If any manufacturer is fortunate enough to make enough profits off of this year's business to go into the excess class he certainly is entitled to keep this money if he is going to stay in business and recover from this depression and the losses to which he has been subjected.

"The manufacturers have borne this burden since 1914 and if there was ever a year that they need a breathing spell it is this one. I have faith that our able representatives in Ottawa will be broad enough and far-sighted enough to make provision for this contingency."

### Have Seen the Worst of It

L. W. Smith, manager of the Greenfield Tap & Die Corporation, Galt, believes, as many other business executives do, that we have touched bottom in a good many lines and from now on it will be a case of hard work and up the hill to normal.

Speaking to Canadian Machinery, Mr. Smith states:

"It is our feeling that the worst has been reached, and that there is a slight improvement in the general condition, that is in regard to the number of orders that we are receiving, and shipping slightly more than we were during November and December.

The improving condition is not such that it enables us to take on more employment as stocks have been brought up to a maximum and it will be necessary for us, as small tool manufacturers, to work on this stock until production orders in quantities are being received.

"I find that some of the factories in the automobile line, are putting on more help, and I am advised by some that in other month they will be in the market for production tools."

### The Stock Order Heard Of

The stock order, that more or less reliable evidence of return to normal business conditions, is again making a voice in the land.

From various sources comes reports of this very encouraging turn of affairs.

"We are more than holding our own," said a Niagara district manufacturer to Canadian Machinery on Friday last. "Not only is there a good undercurrent of enquiry, but yesterday one of our oldest dealers called and placed a very nice stock order, payable in 30 days."

"Yes, there has been a marked improvement during the past few weeks," said a Western Ontario manufacturer of small tools. "Enquiries are good, nice business is coming in by mail and stock orders are beginning to make their appearance."

## Business Morality Ebbs

"THE most painful thing about the difficult business situation which we have just been passing through," said Herbert K. Twitchell, President of the Chemical National Bank, "is the widespread slump in business morality. The war and the business situation that followed the war seem to have left the human race on a lower ethical level than it was before. This is not only true in Europe, in South America and in other parts of the world, but it is, unfortunately, true in America.

"American business men and bankers have been rather fond of pointing with pride to the high standard of business ethics in this country, and there is no doubt that this standard has, until lately, been very high, taking the business world as a whole. But the revelations of the last few months make it necessary for us to revise our good opinion of ourselves as a class.

"Men who a few years ago would not have dreamed of repudiating a contract, or trying to wiggle out of a bad bargain by subterfuges or resorts to technicalities, are doing these things today almost unblushingly. Cancellations of orders given and accepted in good faith are made on the slightest excuse or no excuse at all. Corporations, firms and individuals whose business honor has heretofore been unsmirched have weakened under the strain rather than do what every honest man does—take the loss and stand the consequences. Bankers see every day new evidences of such weakening of the moral fibre of concerns that have long enjoyed the respect and confidence of the business world."

# MARKET DEVELOPMENTS

## Tool Builders are in Session This Week

### Some Announcement May Come, Following the Cleveland Meeting—Steel Prices are Being Trimmed in Order to Get Sales —Scrap Metal Market Dead, and Very Few Sales

THERE has been no continuation of the movement that seemed to be getting under way a few days ago toward lower prices in certain lines of machine tools and steel goods. The machine tool builders of United States are gathering in Cleveland this week and there is no doubt the question will be gone into there. A number of these plants are making machines for stock now and they have not much disposition to go ahead doing this, as the tools they are turning out now are high cost.

The steel market belongs to the buyer just now and he is taking advantage of the situation and buying more to his liking than he has been able to do for a good many months past. Anything that looks like a fair tonnage is pretty well carted around before the placing takes place and as a result there are departures more or less marked from quoted prices. The fact that little money is made on many of these sales is set over against the pleasing reality that it allows the warehouses to liquidate their stock and get in shape to buy to the best advantage whenever the turn in the market may come.

Machine tool dealers have a number of inquiries and they are making some fair sales. Some plants have taken advantage of the slack season to improve their method of production. The automobile shops show a slight improvement in the operation schedules and have hopes of maintaining this. Shops having contracts to make auto parts are getting release instructions on these and more employment is the result.

The scrap metal market remains as it has been for weeks past, viz., as near defunct as it can get. There is such a tremendous surplus of copper on the U.S. market that it may be some time before there is a recovery in price. Buyers cannot afford to sell what stock they have, neither can they take chances on buying, so in that atmosphere business hangs suspended.

## PITTSBURGH MARKET SHOWS THAT BARS ARE BEING SOLD AT TWO CENTS

Special to CANADIAN MACHINERY.

PITTSBURGH, Feb. 24.—Enough time has now elapsed since the Midvale Steel & Ordnance Company began quoting prices below the Industrial Board and Steel Corporation schedule to make some appraisal of the situation. This is that Midvale and a few other independent steel producers are actively soliciting business at reductions of a few dollars a ton on most of the leading products, that practically all the other independents are willing to sell at reduced prices, provided the orders offered are large enough to make this worth while, and that the United States Steel Corporation is standing rigidly by the prices it has maintained since the Industrial Board adjustment of March 21, 1919.

As to the volume of business booked at the reduced prices, that is very small. It seems clear that practically no business was produced by the price cutting, the orders placed being chiefly or wholly orders that would have been placed in any event, orders that could not be held back because the need was pressing. As to the Steel Corporation, prior to the break it was booking rather a fair volume of new business, considering the general dullness. In both December and January the bookings were not far below 50 per cent. of capacity. The volume of new business given the Steel Corporation has now diminished very considerably. A more important effect upon the Steel Corporation is a large decrease in the volume of specifications on old contracts being filed. This is, of course, perfectly natural. Many customers of the corporation were taking shipments on their old contracts at a greater rate than was requisite to take care of current consumption, so that stocks were piling up, and when it was made clear that the contract prices could be shaded the customers naturally curtailed their specifications.

#### Extent of Cuts

The extent of the price cutting may be shown approximately by setting down the lowest prices done or quoted thus far by any independent, together with the Industrial Board prices to which the Steel Corporation strictly adheres, and which some of the independents are nominally quoting, until they are offered orders sufficiently attractive to justify cutting: Bars, 2 to 2.35 cents; shapes, 2.20 to 2.45 cents; plates, 2.25 to 2.65 cents; hoops, 2.85 to 3.05 cents; blue annealed sheets, 3.20 to 3.55 cents; black sheets, 4.15 to 4.35 cents; galvanized sheets, 5.35 to 5.70 cents; plain wire, 3 to 3.25 cents; wire nails, $3.10 to $3.25.

In standard steel pipe there is little if any shading, the standard price being a basing discount of 57½ per cent., but there are various price irregularities in specialties in tubular goods. In tin plate it seems clear that there is absolutely no shading by any mills on orders for actual production from the standard price of $7 per base box, 100-pound, but for quite a while past there have been offerings at second hand from stocks at deep cuts. At first these were chiefly by New York export houses, who had bought tin plate for export and did not complete the transaction, but lately there have been offerings by some domestic consumers.

#### Attitude of Independents

It being quite clear that the volume of steel business secured by the price cutting has not justified the making of

these reductions, for with the high costs ruling, partly due to the reckless manner in which independents operated when they were securing very high prices, and partly due to the light operation at present, there was not much room for cutting, the question arises, why did the independents start to cut prices? There are only two possible answers, that the independents made a mistake and that they did not make a mistake. They might have made a mistake by thinking that a reasonable amount of business could be gathered up by cutting prices, sufficient to give something like a fair operation and thus justify selling at close prices, or even at an apparent loss, by comparison with previous costs, because by economizing during the operation they could pare their costs. Such a result has not come. The amount of business secured is plainly not worth while.

If the independents did not make a mistake, then they expected what has occurred. What has occurred is that they secured very little business, and that the business of the United States Steel Corporation is greatly reduced. The corporation operated at about 92 per cent. in November and December and at an average of about 90 per cent. in January. Its operations were certain to taper off, but probably at no great rate. Now, however, the corporation's operations were at only about 80 per cent. last week and they are at less than that this week, with a prospect that in a very few weeks they will be quite low, under 50 per cent. and perhaps down to 30 or 40 per cent. The corporation's new business and specifications against old contracts have both fallen off, and a good many customers are probably instructing it to delay shipment on some of the material already specified.

This decline in Steel Corporation business is attributable in large part to the price cutting. There may be an advantage in that to the independents, on the theory that whatever steel the corporation makes is irretrievably lost to the independents, whereas by mixing things up the independents may secure a sort of redistribution. This is not theory, but the actual statement, made privately, of some of the independents.

Then there is the matter of wages. The independents have been wanting to reduce wages, and some of them did as long ago as last December, while others have only lately reduced, the Youngstown mills making reductions of about 20 per cent. last week, while the Steel Corporation has not reduced wages. The independents feel that if the corporation has to cut prices it will also reduce wages. Some of the independents did not take kindly to all the wage advances the corporation made during the war, and there was some feeling on the subject in the latter part of 1919, when the independents were disposed to advance prices. The attitude of the Steel Corporation at that time seems to have been "If you advance prices you will have to advance wages—why not advance wages first?" What occurred, however, was that the independents advanced prices and then the corporation advanced wages without advancing prices, the independents then having to advance wages also.

## POINTS IN WEEK'S MARKETING NOTES

**Only one or two odd price changes were noticed this week in the machinery market. It is felt that some announcement may be made following the meeting of the Machine Tool Builders in Cleveland this week.**

—

**Some of the automobile shops are beginning to operate at a fair rate and orders are being released to firms that had contracts held up on the making of auto parts.**

—

**The steel market distinctly belongs to the buyer at the present time, and there is a decided tendency on his part to take full advantage of the situation, with the result that prices are being cut pretty close in this district.**

—

**Merchant bar mill material is quoted at 4½ cents a pound in Toronto, while Montreal puts the price this week at 4¼.**

—

**United States machine tool builders are not inclined to go ahead building more machines for stock, and some of them are considering further curtailing their operations.**

—

**There is no improvement whatever on the scrap metal market. The yards are not buying and inquiries coming in are very meagre. The fact that prices are at a very low ebb is not having any effect on increased buying.**

—

**The record of sales in U.S. pig iron market brings out the fact that $25 is going to be more and more recognized as the market price, and sales are being made in several places at that figure.**

—

**Operations of the Steel Corporation are said to be below the 80 per cent. mark now, with the prospect that in a few weeks they will be well down towards the 50 per cent. mark.**

—

**It has been stated by Engineer F. A. Gaby, of the Hydro Commission, that if work progressed at the present rate on the Chippawa Canal power should be ready for delivery about Sept. 1 of this year.**

As the market is extremely quiet as to actual developments, the tactical position and aspirations of the producers seem to be the important feature, as giving a line on what may be expected in the future.

**Pig Iron**

The first sales of basic pig iron of any consequence this year have just occurred, developing a new low price, $25, valley, or a sharp decline, as on January 1 the market declined from $33 to $30 by furnaces voluntarily quoting the lower price. There was no record of any sales of consequence until the $25 sales just made, which included at least one lot of 1,000 tons. Bessemer is now priced at $27, valley, with reports that a few carloads have been sold at this figure. Foundry remains quotable at $28, valley, with an occasional carload going. On any sizable lot these prices would probably be shaded. The prices are below actual cost, based on recent records, but costs will have to come down. The question just now seems to be whether pig iron prices are going to dictate coke and ore prices, or coke and ore prices are going to dictate pig iron prices, as of course furnaces would not sell at a loss for any length of time.

## BETTER SALES ARE REPORTED

**Some Lines Seem to be Gathering in Greater Volume of Business Now**

TORONTO.—The price movement that seemed to be making headway last week finds little more progress this week in the machine tool market. Makers seem to be more confident that prices are not going to change. Nor are there any who claim there is a great clamor for a better figure, while on the other hand there are a few who believe that the new prices they have been able to give have helped in placing some machines.

It must not be imagined that the machine tool market in this district is at a standstill, for there are some very nice sales being made.

The automobile shops are starting to run again, and places that had contracts to make parts are getting under way. It is a rather slow process, as none of the shops feel justified in going ahead full blast until the attitude of the buyer is more marked.

Oshawa shops have taken back all their married men, and a number of single men, who were skilled in certain operations, and who had left when work fell off, are being sent for. A conservative estimate would place the operations in the shops there at 50 per cent. of normal. In Chatham and Walkerville the makers of cars and parts are also getting a start and expect to add to their number from time to time.

Inquiries are better, although it is still difficult to convert these into new business. Nearly all these inquiries are

new ones in the market, and for the most part are pretty well scattered.

Some of the sales that have been made in Ontario particularly are the result of a lot of work on the part of the salesmen. In some cases it has been possible to show firms where they could make a real saving by changing equipment, or where present equipment could be supplemented to advantage by some additions. The past few weeks has provided a good time to get this work done in order to be ready for the start which is now being made in several of the plants.

The buyers are in possession of the steel market, and they know it. Any purchaser who has a good-sized order seldom places it at once. One of the steel merchants, speaking about this a few days ago, remarked that, "Every order, especially if it is of any size, is being peddled to the limit now, and by the time the buyer has made the rounds he has a price that is pretty close to what he wants to pay."

"And are prices sagging as a result?" was asked.

"In some cases they are," was the answer. "Just now warehouses are working off as much of their stock as possible, and when they see a chance to get rid of a slice by naming a close figure they are going to do it. In fact, if it is going to bring business into the market, they have to do it as buyers are needed just now as much or more than they ever have been before."

Another merchant, who has been doing some aggressive publicity work, stated that the first of the week had seen a nice lot of business coming in, more than they had taken in for some time previously. They did not want to place the interpretation on this that business was permanently better, but for the meantime they were willing to admit that the orders were the best they had seen for some weeks past.

None of the warehouses are taking in much material. What is coming in is simply by releasing some of the orders that have been held up.

Both mills and warehouses are out looking for business just now, and prices are suffering a little as a result. Bars, for instance, have been quoted at 4.75 per pound for some time past, but better than that has been done right along, so this week we are changing the figure to 4.50, at which price the bulk of the sales are being put through.

Local steel men are watching with interest the developments at Pittsburgh, the general feeling being that the price of bars will not go much below 2 cents, as costs are still high, and a revision of wage schedules will cause more or less trouble and make buyers look for still greater reductions.

Tube business is coming in fairly well, although the orders are very scattered and smaller than usual. Sheets are quiet, the demand being limited. Plate is not selling to any extent.

# MACHINE TOOL BUILDERS MEETING IN CLEVELAND TO DISCUSS PLANS

Special to Canadian Machinery.

NEW YORK, Feb. 24.—The National Machine Tool Builders' Association will meet on Thursday of this week in Cleveland to discuss the present business situation.

Among the specific subjects scheduled for the conference are "The Present Business Situation and How to Meet It," "Principles of Sound Financing for the Machine Tool Industry" and "How to Run a Machine Tool Shop in a Time of Depression." In connection with these subjects the plans of the executive committee of the association for the adoption of a uniform cost finding method will be under consideration. It is believed by many that the cut-throat competition which existed in the machine tool trade prior to the war was due largely to an imperfect knowledge of costs. The association's executive committee has employed a firm of accountants, Scovell, Wellington & Co., Boston, who have been conducting an investigation during the past few months under the guidance of E. F. Du Brol, general manager of the association. Six district meetings were held at which cost data were produced by all members of the association, and from these data average cost prices have been arrived at to be used as the basis for the cost finding system.

The machine tool trade is making rather slow progress toward an improved business condition. In fact, in some lines it is doubtful whether any progress at all is being made. Some machine tool companies which up to this time have been working at least a few days a week are now seriously considering shutting down their plants entirely, as they no longer feel justified in building machines for stock at present high costs. While buyers naturally point to the continued high prices of tools, it is not in accord with the facts to say that any considerable amount of machine tool business is being held back solely because of high prices. As long as there is so little work for machine tools to do, it follows that there cannot be much demand for tools. In other words, until there is a much better demand for the products which are made on machine tools there cannot be a much better demand for the tools themselves.

Domestic inquiry and sales are light. A little foreign business is trickling through, principally from Japan. The Japanese navy has been buying quietly in this country for a month or so. Among other export inquiries are some from India and Russia.

# CANADIAN ENGINEERING SKILL TO HELP OPEN UP MORE NEW MARKETS

Canada is having a large part in development work that is taking place on the Gold Coast of Africa. H. F. Walker, of Edmonton, who passed through Toronto a few days ago, is one of the first of a field force of about 50 Canadian engineers who will share in the money to be made in the "big job"—which is to open up the rich provinces of the Gold Coast, Nigeria, Togoland and the Cameroons. The entire undertaking to which Stewart & MacDonnell are committed with the Home Government will involve expenditures through them by Great Britain of approximately $60,000,000, work on the first unit beginning April 15, to be completed within seven years, and cost in approximately close figures $7,000,000.

### Canadians Direct Work

Not only will Canadian brains direct operations, but the heads of all departments will be men of Canada, a party of 50 following within 30 days. London operations will be personally directed by Hon. Angus MacDonnell. He was one of the contractors building the Cowichan Lake extension of the C. P. R. lines on Vancouver Island a short while ago. Canadian material and equipment also are to be used as extensively as possible in the Gold Coast operations, transport charges considered and later Canadian cars, steam shovels, locomotives, cement, etc., are to be sent over by shiploads, expectations being that at least $2,500,000 worth of British Columbia Douglas fir alone will be required. Mills at Chemainus are now working on the first orders and looking for bottoms to transport the initial and later cargoes.

### New Markets For Canada

Hydrographic surveys, preliminary to the work, have been conducted during the past year under the direction of Rear-Admiral Sir John Parry, who, during the war, was engaged in surveys for the Admiralty on the Canadian coast. It is expected that development of these hitherto untouched domains of Africa will foster important new markets not only for Great Britain, but particularly for Canada.

---

**New Premises.**—The Diamond State Fibre Company of Canada, Limited, are moving into new premises in the Wrigley Building, Carlaw Avenue, Toronto, on or about March 1. This building is twice as large as their present premises. A private railway siding will facilitate greatly the delivery of shipments.

# *Price Tendencies of Iron, Steel and Copper*

THE lack of enough energy to establish a new market level is probably what leaves the U.S. Steel Corporation and its Industrial Board prices as the recognized standard in the steel world.

How long that position can be sustained is a matter of pure and simple guessing, wherein one man's guess is as good as another's.

A definite move has been made by some of the independents toward a lower price—in fact the idea seems to be just now to find out where to establish a price level that will cause buyers to come out and take hold.

The Pittsburgh correspondent of Canadian Machinery says that the price of bars is now recognized at 2c pound, or $7 per ton under the Industrial Board prices. A further drop is hardly to be expected from this figure.

It is interesting to compare this with previous quotations from Pittsburgh. Below we show high and low prices from 1912 to 1919, as well as yearly averages:

| Year | High | Low | Average |
|---|---|---|---|
| 1912 | 1.40 | 1.10 | 1.25 |
| 1913 | 1.40 | 1.22 | 1.38 |
| 1914 | 1.22 | 1.05 | 1.15 |
| 1915 | 1.75 | 1.10 | 1.31 |
| 1916 | 2.93 | 1.87 | 2.48 |
| 1917 | 4.50 | 2.90 | 3.49 |
| 1918 | 2.90 | 2.78 | 2.89 |
| 1919 | 2.70 | 2.35 | 2.43 |

The ten-year average for years previous to the time covered by this table, say from 1904 to 1913, puts bars at 1.403c per pound. So it will be seen that the Industrial Board price at 2.35 is fairly well removed from that figure. The average from 1912 to the end of 1919 is 2.04c per pound, the average being shoved up by the prices of 1917, for taking that year out the average from 1912 to the end of 1919 is 1.84c per pound.

### Pig Iron Prices Compared

Pig iron is having a difficult time standing up to any supposed schedule and a determined effort seems to be under way to batter it down to $25, which would be well above the average of previous normal years. Here is the showing for a ten-year period from 1910 to 1919, taking Buffalo quotations, as that is the principal point of competition Canadians have to meet:

| Year | High | Low | Average |
|---|---|---|---|
| 1910 | 17.25 | 14.50 | 15.55 |
| 1911 | 14.25 | 13.50 | 13.84 |
| 1912 | 17.61 | 13.62 | 14.89 |
| 1913 | 17.25 | 13.07 | 14.87 |
| 1914 | 13.50 | 12.08 | 12.84 |
| 1915 | 17.77 | 12.44 | 13.98 |
| 1916 | 33.56 | 18.00 | 20.63 |
| 1917 | 50.64 | 33.39 | 40.41 |
| 1918 | 35.25 | 33.50 | 33.97 |
| 1919 | 39.19 | 27.00 | 30.53 |

Worked out, it will be seen that the average for those years is $21.16 per ton. This figure has been brought up by the inclusion of high-cost war years. Take the first six years of that period, 1910 to 1915, and it is seen that Buffalo was selling pig iron at an average of $14.38 per ton.

The war years, when the effect was felt on pig, viz., 1916-17-18, shows an average at the same point of $31.67 per ton. The quotation for Buffalo at this writing is $29.25 to $31.25 per ton, or a half-way price of $30.25 per ton.

Summarized, it gives these results:

| | |
|---|---|
| Ten year's average, 1910 to 1919 | $21.16 |
| Six year's average, 1910 to 1915 | 14.38 |
| War year's average, 1916-17-18 | 31.67 |
| Present average | 30.25 |

It is not the purpose of this article to go into the matter of costs, which have increased very largely on every hand. Nor has there been any advances made in the way or method of production that would serve to cut prices, for methods used now are to all intents and purposes the same as in the pre-war, cheap-cost years.

### The Case of Copper

Copper is one of the metals that has taken its "bumps." The statement is made in the trade now that copper cannot be produced at the price at which it is sold to-day, and there is no good reason to doubt the statement. As a matter of fact copper for the thirty-year period from 1890 to 1919 averaged 15.68c per pound, while the quotation at this writing is 13½c per pound.

The highest price on record for Lake copper on the New York market was in 1864 at 55c per pound and the lowest point recorded was in 1894 at 9c per pound. In the war years copper fared well, touching 36c in 1917.

### Where Sheets Stand

The prices on which the following tables and quotations are based are at Pittsburgh. Sheets are usual black sheets, No. 28 gauge. One would hardly believe that at the end of 1914 and the beginning of 1915 sheets were quoted at 1.70 to 1.80c per pound. Take the ten-year performance, 1910 to the end of 1919:

| Year | High | Low | Average |
|---|---|---|---|
| 1910 | 2.40 | 2.15 | 2.29 |
| 1911 | 2.20 | 1.84 | 2.03 |
| 1912 | 2.25 | 1.80 | 2.00 |
| 1913 | 2.35 | 1.98 | 2.20 |
| 1914 | 1.98 | 1.80 | 1.89 |
| 1915 | 2.53 | 1.74 | 1.93 |
| 1916 | 4.40 | 2.60 | 3.06 |
| 1917 | 8.00 | 4.50 | 6.29 |
| 1918 | 5.00 | 4.82 | 4.98 |
| 1919 | 4.70 | 4.35 | 4.43 |

That makes the average of that period 3.11 per pound, hardly a fair comparison. Taking out the three wild years, 1917-18-19, it gives an average of 2.20 for the first seven years, 1910-16. The present price at Pittsburgh is 4.35, although there have been departures from this. Summarized, it gives:

| | |
|---|---|
| Ten years, 1910-19, average | 3.11 |
| Seven years, 1910-16, average | 2.20 |
| Present price | 4.35 |
| Average 1917-18-19-20 | 5.01 |

These four lines, bars, copper, pig and sheets, have been taken because they are quite representative of the iron, steel and metal classes. Copper alone has done more than its share toward coming down to a working basis and it is a very safe guess that the improvement of industrial conditions, already under way, will bring copper up from its lowly position. Iron and steel have so far stood more or less aloof from the tendency of prices to skid. They have receded greatly from some of the "peaks," but these peaks cannot be accepted as market standards, most of them being brought about by the persistent desire of the consumer to secure prompt delivery regardless of price.

B. J. McCORMICK,
General Sales Manager, Canada Foundries & Forgings, Ltd., Welland.

# *Strategic Loss Essential to an Effective Offensive*

## We Are in the Midst of Reconstruction Instead of at the End of It—All Sections Must Have Their Bumps

THAT a strategic loss is essential to an effective offensive in present business conditions, is the view held by B. J. McCormick, general sales manager of Canada Foundries and Forgings, Limited. Speaking to the Ontario Retail Hardware Association in Hamilton a few days ago, Mr. McCormick reviewed many phases of the situation that have a very direct bearing on the machine tool, small tool, iron and steel markets in general.

Referring to business prospects for 1921, Mr. McCormick said that "consciously or unconsciously factory managers are answering this question by the plans which they are now laying for future operations. No one can answer correctly with assurance, but a knowledge of conditions and the economic laws that govern those conditions will aid in making the answer more authoritative. All the ablest theorists and members of the oldest and wisest schools of economics have guessed during the last three months about what was the matter with industry, and what would happen within the near future. You ask for my opinion, but all I intend to do is to discuss the matter with you.

"The year 1920 with its profits and losses, and mostly losses, has passed into history. There are several viewpoints from which to look into 1921. The productive and distributing machinery of Canada is very finely balanced and it is a well-known fact that all industry and commerce prospers and suffers together. We have experienced seven-year periods of depression or trade fluctuation. The average length of previous depressions have been about one year, some of shorter periods and some longer.

### Reconstruction

"Most merchants seem to think that one big slash in prices would have the same effect as a fairy waving her wand, that all our troubles would at once vanish and be over, and that our readjustment would be completed. A good many of us thought that the year 1920 was to be the readjustment period, but we were all wrong. The year 1920 started with an unprecedented demand for every article known to commerce, and factories were so crowded with work that they had no time to readjust. In fact, labor asked for and received more concessions in 1920 than during any previous year of the war. During the month of April, 1920, we offended our customers by refusing to bid on over a million dollars' worth of inquiries because our production chart was filled for the entire year on that class of goods.

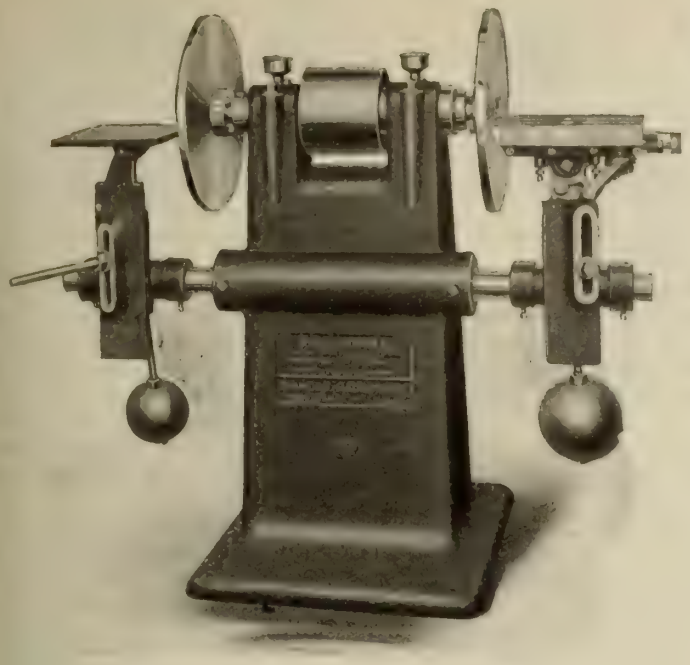
"Then came the shock, and industry mediately went into low gear about October, and here we are.

"My opinion is that this is the real period of readjustment, and our whole industrial and commercial structure is being tested by the strain, but those who have builded wisely and well have no cause for alarm.

### It Rests With Steel

"My personal vision of the future is bright, pleasant and a reassuring one, but the process of reconstruction must continue until every factor contributes to the result which we attain. Wheat, cotton, tobacco, sugar, leather, rubber, lumber tea, and coffee and other raw materials, including copper and zinc, have taken a big slump in the last three months, some of them going even below pre-war prices, but I wish to call your attention to the one point which I wish to impress upon you to-day, and that is, that iron ore is the only raw material which has held firm.

"Why? Because wages have not been revised by the steel interests who perform the first seven processes of this great industry.



"Manufacturing implies buying. If nobody wants to buy what the factories make, the factories very soon have to switch off the power and put a padlock on the door. There never has been a time and there never can be a time when nobody wants to buy; but enough people can stop buying, or can curtail their buying, to make a big dent in manufacturing processes and that is just what has happened in this country at this time. There has been, and at the present time of writing there still is, a buyers' strike. It was, and is, psychological. Nobody could have done anything to prevent it. No one alone and unassisted can do very much to stop it. Buying is based on confidence—confidence that prices are fairly stable—that they will not decline recklessly over night. This is true of both individuals and of corporations. It is clear that business and industry in general must take certain broad steps before confidence is returned. It remains for the industry, whether it be manufacturer, jobber, or retailer, that has not already done so, to make the plunge; to sacrifice if sacrifices are necessary, but in any event to get back again on a workable basis of confidence. What we all want to know to-day is when will that period of relative stability likely be reached, and then and only then will the wheels of commerce speed up.

"In New York there was a meeting in January of jobbers at which they formed a policy to trade among each other, rather than purchase direct from manufacturers. Their slogan was 'Don't buy anything from the maker until he is down to pre-war prices.'

"This buyers' strike will and has slowed up production in our factories with all its disastrous effects of non-employment. Slow production begets higher costs.

### Pig Iron

"This is an expression used by most hardware buyers, 'Pig iron is down $5 or $10 per ton.' This is a stock phrase and generally used as an opener with most of the hardware salesmen. Do not use this poor, old, hackneyed phrase because it shows at once that you are not familiar with the basic principles of your own business, and it makes you look like

# DIAMOND
## DISC GRINDERS

Good grinding in fast time has made the Diamond popular in a host of shops. The right design and build eliminate vibration and give the operator a perfect surface every time. There is a suitable size and equipment for every surface grinding job you have. Workmanship and material of "Diamond" quality throughout.

May we send you catalogue?

*If It's Machinery, Write "Williams"*

64 Front Street West
TORONTO

a man coming into a ball game at the seventh inning, and asking your neighbor what is the score. It would be just as reasonable for you to ask the price of iron ore at Lake Erie ports, or even more reasonable still to ask what is the rate of pay at the mines at Oliver, Minn.

"The foundation of the whole structure known as the steel industry is what is commonly called labor. In using this word—labor—I wish to impress you with the fact that I do not use it as a hostile expression, but with thoughts most respectful and friendly. I would ask when I use the world labor that you would immediately interpret it as meaning 'Physical application of human energy, plus intelligence, knowledge and skill, applied to material things such as woods and metals.'

"Labor is the greatest contributing factor to costs in our industry to-day, and in fact, the determining one, with transportation coming next. Labor again is the chief factor in transportation charges.

### U. S. Steel Method

"The United States Steel Corporation in their system of cost practice value iron ore in the ground at only 10 cents per ton because it is only just plain mud. They reason that by the application of human energy, plus intelligence and skill, and aided with modern tools and equipment and with a further application of heat, they can convert this mud into merchant bar and pass it along to the general steel working industry at a profit. I figure the steel industry on the same basis as a nine inning ball game, the seventh inning or operation is the blast furnace turning the ore into pig iron, while the eighth and ninth processes are where the metal working industries of Canada begin to function, and the greatest contributing factor which we have to reckon with is wages—because no industry with too heavy a burden in this respect can produce its wares or deliver its services at reasonable prices unless this factor of remuneration contributes.

### Remuneration

"The man who first takes a rough bar of wrought iron may be a blacksmith who has only partly learned his trade and has no ambition to rise above the anvil. The best possible thing he can do with his bar of iron is to make it into horseshoes, and he congratulates himself upon his success. He reasons that the rough lump of iron is worth only three or four cents per pound and that it is not worth while to spend much time or labor upon it. However, his enormous muscle and small skill has raised the value of this lump of iron say from $1 to $10. In modern factory practice this man's remuneration would probably be based on weight, and the market price of pig iron might possibly be considered in naming a selling price.

"Along comes another artisan known as a cutler, with a little better education and a little more ambition, and looking at the blacksmith and his product says: 'Is this all you can see in that lump of iron? Give me a bar and I will show you what brain and skill plus hard work can make of it.' He has seen a little farther into the rough bar. He has studied many processes of hardening and tempering. He has acquired tools and grinding and polishing wheels and an annealing furnace. Under his hand the iron is further fused, carbonized into steel, drawn out, forged, tempered, heat soaked and quenched in liquid of some nature to improve its tempering and finally ground and polished with great care and patience. When this work is done he shows the astonished blacksmith $1,000 worth of knife blades, where the latter only saw $10 worth of crude horseshoes.

"In our present shop practice this man's remuneration would be based on count and quality.

"Along comes another artisan and looking at the product of the cutler, he says: 'Knife blades are all very well if you can make nothing better, but you haven't half brought out what is in that bar of iron.' He can see higher and better uses. The third artisan has a more delicate touch, finer perception, higher ideals, better training and superior de-

termination, which enable him to look still further into this rough bar—past the horseshoes and past the knife blades—and he turns this crude iron into the finest needles, with eyes cut with microscopic exactness. The production of the invisible points requires a more delicate process, a finer grade of skill than the cutler possessed. This feat is considered marvelous and the third artisan thinks he has exhausted all the possibilities of the iron because he has multiplied the value of the cutler's product many times.

"This man's daily remuneration would undoubtedly be based on quality only.

"Along comes still another skilled mechanic with a mind more finely organized and a still more delicate touch, more patience, more industrious and higher order of skill, together with better training, and he passes with ease by the horseshoes, the knife blades, and needles and returns the product of his bar of iron in fine hairsprings for watches. Where the others saw horseshoes, knife blades and needles only worth a few thousand dollars, his penetrating eye shows a product worth tens of thousands and following the process down still further we find the little barbed instruments used by dentists to draw out the finest branches of dental nerves being sold at a price worth hundreds of times as much per pound as gold itself.

"The remuneration of this classification of man is fixed neither on weight, count nor quality. His type is so scarce and so much in demand that he commands the maximum wage with the minimum output.

"By the application of this human energy, intelligence, skill, patience and scientific training, together with the use of modern plant equipment and machinery, our products of commerce are produced, and in some particular lines the price of pig iron per ton at the blast furnace practically has no meaning at all, because the one main thought, the one big factor that enters into the whole proposition, is the value of the human energy involved.

"These are my reasons for advising you never to use the old stereotyped phrase—that pig iron is down.

### Decline Comparison

"Comparing advances of average commodities between the years 1914 and 1920 we find the following comparative views. The United States has reduced these advances 66 2-3 per cent., England 40 per cent., France 25 per cent. and Canada 30 per cent.

"Therefore, taking these other countries as a competitive basis, we must have a further average reduction of 10 per cent. to be on a par with Great Britain, or a further average reduction of 36 2-3 per cent. to be on the same footing as the United States.

### Equal Contribution

"When the manufacturer and the jobber and the retail man contribute to deliver goods to the consumer and having done their bit by contributing their surplus profit, and the ultimate consumer still maintains the attitude that the price is still too high, only one factor remains, namely, wages, and if wages will not contribute, then production ceases until it does. Wages must conform to the new basis of commodity prices, not because we want it so, but from the very nature of things.

"When I use the word 'normal' I do not by any means mean to convey pre-war prices, because I feel that we could be a happier and more prosperous community if wages received their better share of reward than in the old pre-war days, and I am inclined to think that wages will.

### Retailers' Attitude

"Recently the Financial Post sent out a questionnaire to the bank managers from coast to coast on which were six questions, and one of the most important questions included was: 'Is the retailer reducing prices as far as conditions warrant?' Two hundred and sixty-eight centres reported that retailers were NOT making price reductions warranted by conditions; thirty centres repofted doubtful replies, and two hundred and fifteen reported Yes. The genuineness of sales being held in many places was seriously questioned by the bank managers, who pointed out that the retail trade does NOT feel disposed to take its losses.

### Dull Seasons

"Dull seasons call for economies and it is always good business practice to keep your assets liquid. Cash on hand is more useful than shelves full of stagnant stock bought at prices the public will not meet. Ready money makes it possible to purchase new fresh goods at present values and puts the merchant on an up-to-date selling basis. It is sometimes better strategy in taking a loss than by sitting tight and playing a waiting game. A strategic loss nowadays seems to be essential to a most effective offensive. The manufacturers and jobbers have taken theirs—WHY NO YOU?

"All elements in our national make-u seem to be willing to go down the bum the-bumps but labor, and it seems t prefer to simply look on as a bystande and watch the sport.

"We are all anxious to get back t normal, but can we do so until ever factor contributes, and normal wages an profits are resumed?

"Nobody knows whether prices are g ing down to pre-war levels or not. does not now seem probable that the will in view of the difficulty of deflatin wages; but one man's guess is as goo as another, so all we can do is 'hope Not the hope that sits idly and waits i uncertainty, but the hope that works an makes dreams come true. Normal time will return when the minds of men be come normal.

### Well, Here's a Slogan

"In the meantime, let us adopt th new Canadian slogan—'Let us throw th hooks into our job instead of into eac others.'"

The various processes in the produc tion of iron from the ore, showing th relation of labor, were described a follows:

First—Steam shovel from mines an tools or burden.

Second—Railroad to upper lake por and burden ore.

Third—Dock organization—loading in to boats—burden.

Fourth—Lake transportation—burder

Fifth—Unloading at Lake Erie port burden.

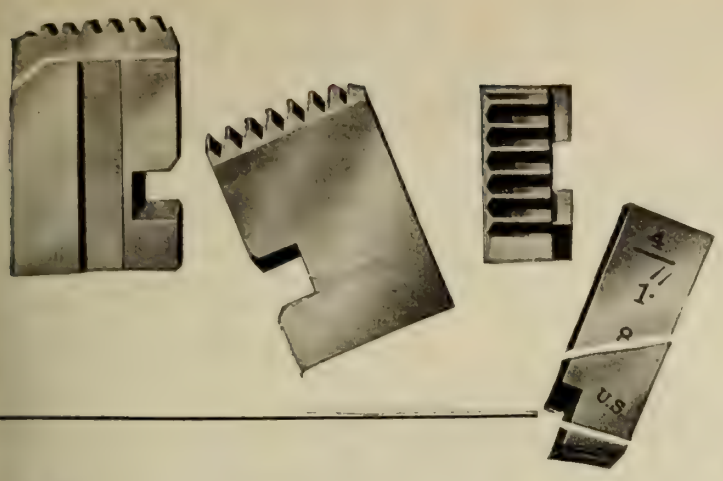
Sixth—Railway transportation to fur nace—burden.

Seventh—Blasting ore into pig—bur den.

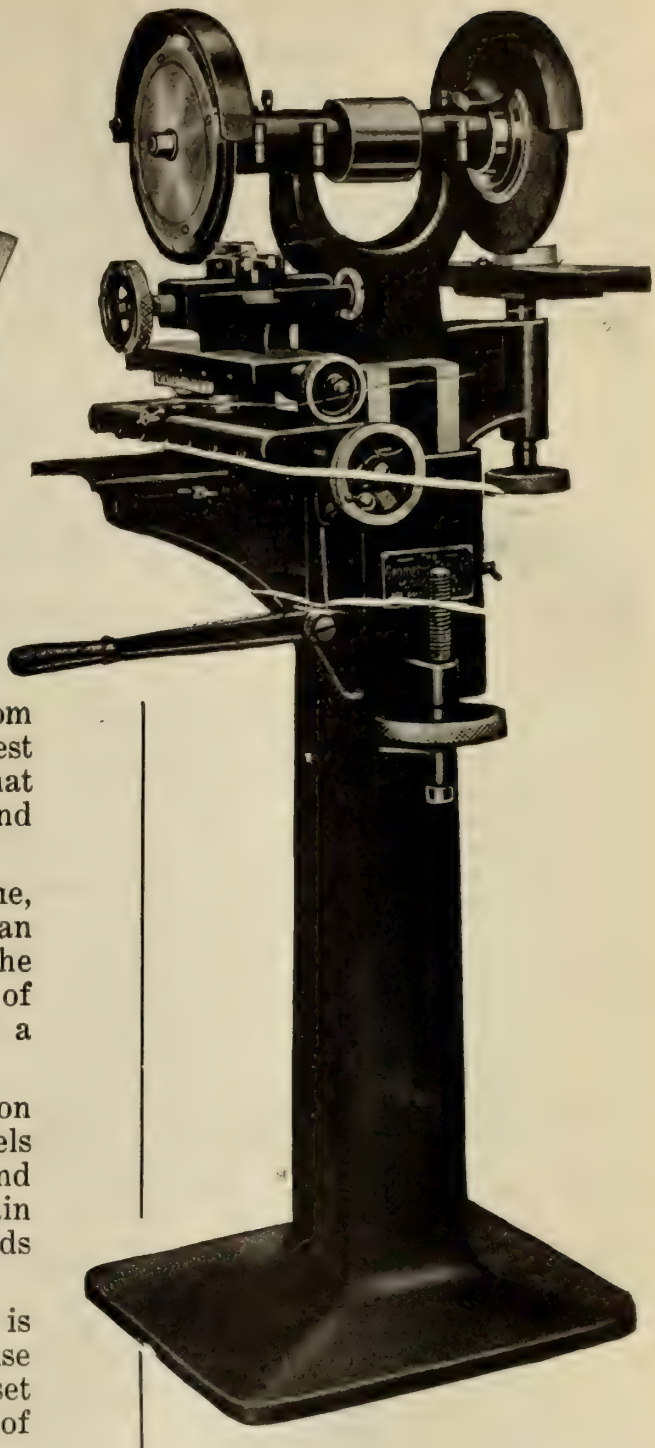
Eighth—Rolling mill—pig iron int bars—burden.

Ninth—Manufacturing bars into tools etc.

Note—It takes four tons of iron or besides limestone and coke to make on ton of steel. Three tons ore plus all it burden are waste.



## WELL, HERE'S A SLOGAN FOR 1921



A LOT of people are spending good time right now standing around in a sort of business circle, wondering when the other chap is going to come down—wondering if some competitor is going to come along and cut the ground from under his feet—wondering if things are going to get much worse before they start to get better—wondering if they can throw the harpoon into some competitor who looks as though he were getting ready to make a start.

Well, in this address Mr. McCormick hands out a pretty good cure for this sort of business dizziness and industrial liver complaint. Short, but pithy, here it is:—

"Let us throw the hooks into our jobs instead of into each other."

Pretty fair, isn't it? We don't know whether it came out of the Welland shop, whether it has been heat-treated or quenched, but it has quite a little sermon in it just the same.

# Sharp Chasers Cut Clean Threads

Accurate, uniform threads result only from chasers which are maintained in the highest state of cutting efficiency. This means that chasers must be kept sharp, and ground uniformly.

Even if just touched up from time to time, the chasers respond splendidly, with clean threads. And with this machine — the Geometric Chaser Grinder—the matter of keeping threading tools up to scratch is a comparatively simple matter.

Various makes of chasers can be ground on this adaptable machine. The two wheels permit the easy grinding of both milled and tapped chasers. In addition, the plain wheel lends itself readily to various kinds of tool grinding.

Uniform grinding of a set of chasers is purely a mechanical matter through the use of adjustments which can be accurately set to govern the grinding of an entire set of chasers.

***The Catalogue describing this machine is a mine of information on chaser grinding. Write for it.***

# Shorter Work Day Means *Less Production*

## Results of a Practical Test With a Work Week of 48 Hours or Less—In Some Industries Automatics Determine the Rate of Production in the Factory

AN important statement has just been released by the National Industrial Conference Board, New York, regarding the effect of the shorter work-day on production. Anything given out by this organization can be accepted in a spirit of fairness by either employer or employee, as their object is at all times to have facts available for the better understanding of any situation. The report states:

An extensive investigation of practical experience of manufacturers who, since the beginning of 1919, have reduced their weekly working schedule to 48 hours or less has shown that in a great majority of cases the reduction of hours was accompanied by a decrease in weekly output per worker, according to a report issued to-day by the National Industrial Conference Board.

### Took in 436 Plants

This investigation, which is of timely interest because of the importance of the hours-of-work problem arising out of present industrial conditions, covered the collective experience of 436 manufacturing establishments employing together 373,536 workers, including establishments in the cotton, wool, silk, boot and shoe, metal, and a group of miscellaneous manufacturing industries, and ranging in size from very small plants employing only a few workers to extremely large ones with many thousands of employees. Most of the plants in the textile and boot and shoe industries were located in the East, but those in the metal and miscellaneous industries represent practically all the large manufacturing centers in the country.

In 87.2 per cent. of the establishments studied a reduction to a work week of 48 hours or less was accompanied by a decrease in weekly output per worker. In 8.7 per cent. of the plants the workers were able to maintain weekly production per worker, and in a very few cases (4.1 per cent.) weekly output per worker was increased.

In somewhat more than two-fifths of the establishments which noted a falling off in weekly production, the decrease was approximately in proportion to the reduction in hours. In about one-fifth of the establishments showing reduced weekly production, the loss in weekly output was less than proportional to the reduction in hours, and in approximately a sixth of the establishments which decreased weekly production, the decrease was greater than proportional to the reduction in hours.

It was found, the report says, that the character of the work, that is, whether the process was largely handwork or machine work, for the most part determined whether or not it was possible to increase hourly output. In those industries, such as cotton manufacturing, where highly automatic machine processes predominated, the output was limited almost entirely by the speed of the machine. In those industries, however, where hand-work predominated, or where the skill and speed of the worker in handling machines were the controlling factors—such as in the boot and shoe industry, or in certain kinds of metal manufacturing—it was possible to increase the hourly output of the workers, in some cases to the extent of entirely compensating for the loss in work time and even exceeding the previous weekly production.

Other factors which were found in the investigation to largely affect production under the reduced working schedule were the general attitude and characteristics of the working force, the supply of skilled labor, regularity in attendance, changes in the personnel of the management or the introduction of improved methods of management or the installation of different or improved machines, all of which accounted in some instances for marked increases in output.

As a rule it was not found that increases in wage rates had any effect upon the efficiency of workers, but in almost every case where a change in output was noted the pieceworkers were more successful in maintaining output than were day workers, and a bonus system in some cases proved an incentive to increased production. It was not found in this investigation that the size of the establishment in itself had any apparent relation to the ability of a plant to maintain output.

With regard to experience in various industries it was found that in cotton manufacturing all the establishments investigated experienced a decrease in weekly output under the reduced hours. In wool manufacturing only one establishment out of 60 was able to maintain weekly output, and in silk manufacturing only one out of the 23 plants studied. In boot and shoe manufacturing, out of the 88 plants covered, it was found that three were able to increase weekly output and 13 to maintain it, while in the metal manufacturing industries, out of 117 plants investigated, nine reported that their weekly output had been increased and 16 that they had been able to maintain weekly production.

## FIRMS WANT TO SELL OUR GOODS

### Two Glasgow Houses Are Interested in Handling Canadian Lines

Information regarding the following lines can be obtained by communicating with this paper and mentioning key numbers:

2730. **Concrete machinery.** — Glasgow firm asks to be placed in touch with manufacturers of concrete machinery, including block-making bricks and slabs, and concrete mixers. Cement equal to British standard requirements.

2731. **Iron and steel products** and engineering specialties.—A Glasgow firm wishes to hear from Canadian manufacturers of iron and steel products and engineering specialties.

### SEMI-AUTOMATIC TAPPING MACHINE

A semi-automatic multiple-spindle tapping machine has been developed by the Langelier Manufacturing Company, of Arlington, R.I., which is quite similar to designs previously brought out by this firm. The main spindle is driven by means of a motor located beneath the machine, and by means of belting and gears. The spindles in the multiple head are crank driven and are secured with fixed centres in bronze bearings. The tapping heads are made interchangeable so that different layouts may be obtained. A feature of the machine is the arrangement of the spindle so that taps of different pitch may be used on the different spindles, each tap following its own lead. The work is carried on a table that is raised automatically at the same speed as that of the tap entering the work. The machine is stopped automatically when the tap has entered the desired distance.

The coal mining industry promises to become the most important enterprise of the island of Formosa. Production has risen from less than 350,000 tons in 1914 to over 1,000,000 tons in 1919, and it is estimated that by next year the mines will be close to a 2,000,000-ton basis. In 1919, exports, principally to Hong Kong, Philippine Islands, Shanghai, and Singapore, accounted for approximately 480,000 tons; bunker sales were 100,000 tons; while Formosan consumption was estimated at 570,000 tons. The total coal deposits of Formosa are variously estimated at figures between 691,840,000 tons and 850,000,000 tons. Production could be greatly increased, and an output of as much as 5,000,000 tons per annum is easy of attainment, were it not for defective harbor and transport facilities.

# INDUSTRIAL NEWS

NEW SHOPS, TENDERS AND CONTRACTS
PERSONAL AND TRADE NOTES

## BALDWINS INTEND TO MAKE THEIR OWN STEEL BARS AT TORONTO PLANT

LONDON, England.—The ever-growthe meetings of the boards of the manufacturing corporations in the industrial development of Canada is again demonstrated in a recent statement made by Sir John Roper Wright, Bart., chairman of Baldwins, Limited, the big English firm of engineers.

Addressing the shareholders at Birmingham Sir John said that he was pleased to be able to say that Baldwins' enterprise in Canada was proceeding satisfactorily, and had now reached the manufacturing stage. They had held, as was well known, a very valuable and long-established connection in Canada for their various products, and in order to retain that they found it necessary, owing to the ever-increasing American competition in that market, to consider means of combating it. Therefore, when it was brought to their notice by their agents in Canada that the site and plant of the British Forgings, Limited, at Ashbridge's Bay, Toronto, was for disposal they decided after careful consideration and investigation to enter into negotiation for the purchase, which was completed at the end of May, 1919.

The works as then existed comprised, in addition, to machine and pattern shops, etc., a most modern and well-equipped foundry which proved of great assistance to them in the manufacture of various castings required during construction of the rolling mills. They have also a battery of ten electric furnaces, some of which are being utilized for the manufacture of steel castings.

### Will Have Sixteen Mills

"Four out of the eight mills we have put down are engaged in the manufacture of black and tin plates and galvanized sheets," Sir John Roper Wright said, "the other four are now ready. We have the foundations laid for another eight mills, and the finishing departments are already fully equipped to deal with the output of sixteen mills. We are not yet producing our own steel bars, but it is our intention to do so eventually. We have made a very promising start, and can now confidently look forward to not only retaining, but considerably expanding our trading operations in Canada."

The establishment in the Dominion of Baldwins, with a working capital of £8,000,000 sterling, and a world-known name, is fraught with gratifying possibilities for the expansion of Canadian trade. Other British concerns of outstanding importance are watching with interest the progress of the British firms who have acquired interests in Canadian industry with a view to following their example, and undoubtedly the placing of British capital in existing Canadian manufacturing plants or the actual establishment of branch factories will become in the near future a prominent factor in the industrial expansion of the Dominion.

## ON LONG TRIP FOR HIS COMPANY

**T. A. Ross, of Armstrong-Whitworth, Has Been Spending Few Weeks in Canada**

T. A. Ross, of Armstrong-Whitworth Co., Elswick, Eng., has been in Eastern Canada for several weeks, leaving a day or so ago for Vancouver, on the way to New Zealand. His firm is interested in large installations there, and also in Australia, and Mr. Ross expects to spend some time there before leaving for other points. He will call at various points in New Guinea, China, India, Malta and other places before returning to the old country, expecting in all to be away for at least two years and to cover 20,000 miles yet before reaching home.

Speaking to a representative of Canadian Machinery Mr. Ross stated that industrial conditions in England were still in the process of changing from war conditions to peace, and that it might take a little time yet for labor to become accustomed to the new rates it would be possible to pay under the changed conditions. He was quite certain, though, that under all the trouble that appeared on the surface, conditions were solid and good and would work out all right.

---

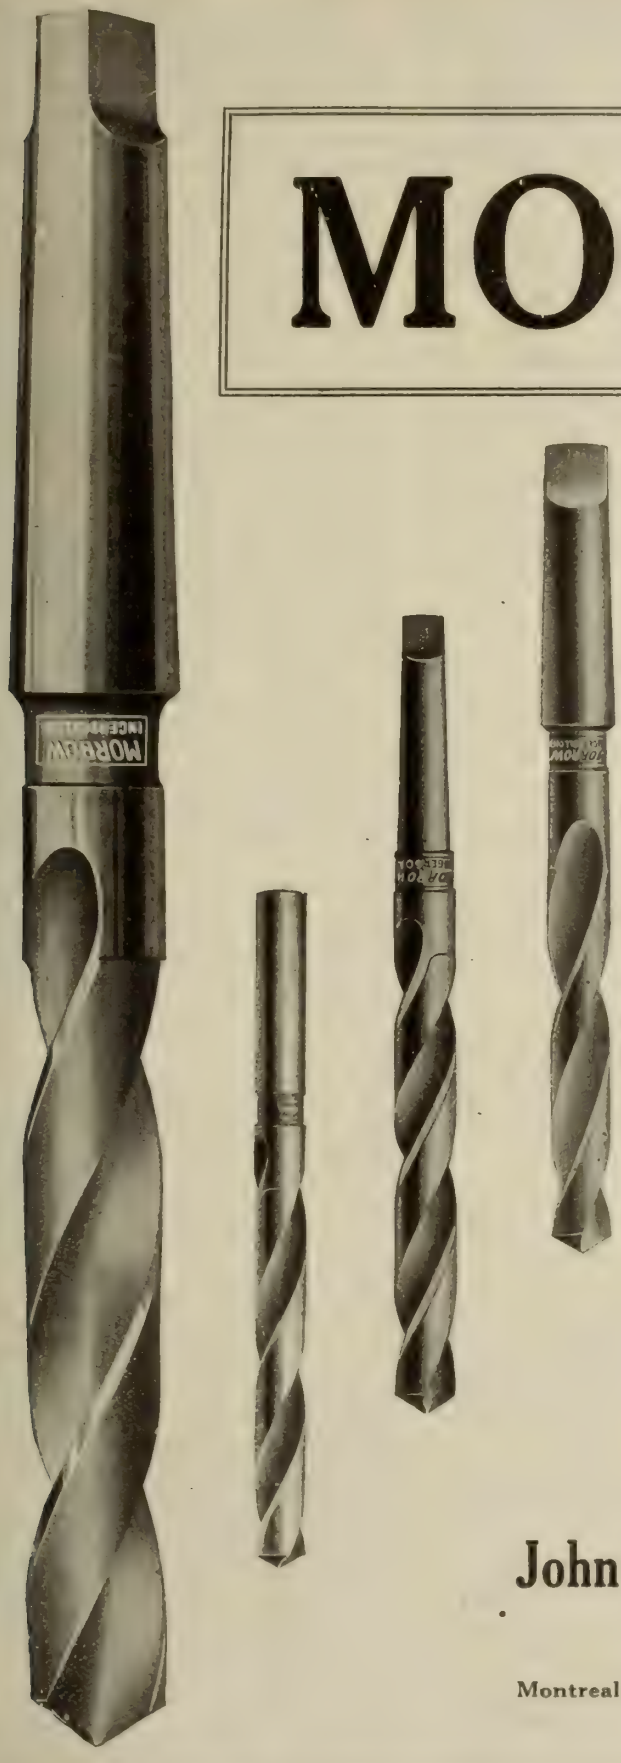
A special train was run to Sault Ste. Marie on February 21, taking expert medical aid to Charles E. Duncan, superintendent of the Algoma Steel Corporation. Mr. Duncan is suffering from an attack of acute appendicitis.

## MERGER THROUGH IN SMALLER SHAPE

**British Empire Steel Corporation Takes on Form in New Arrangement**

MONTREAL.—At the conclusion of ing participation of leading British Dominion Steel Corporation and the Nova Scotia Steel & Coal Companies, it was officially announced that directors of these companies had arrived at an agreement for the consolidation of the Dominion Steel Corporation, Ltd., the Nova Scotia Steel & Coal Co. and the Halifax Shipyards, Ltd., under the name of the British Empire Steel Corporation, Ltd.

The agreements are subject to the underwriting of certain securities, upon the completion of which the boards of the companies will again meet for the purpose of approving the underwriting and fixing the date when the agreements will be laid before the shareholders of the interested companies for their approval.



No indication of what the amount to be underwritten will be is given, or in what form it will be, so that the next meeting of the directors for its approval is a matter of conjecture.

The amalgamation of the Dominion Steel Corporation and the Nova Scotia Steel & Coal Company has been considered by some a logical proposition, owing to the situations and workings of the two industries. The inclusion of the Halifax Shipyards will come as a surprise to some, but not to others. The Canada Steamship Lines have not been mentioned, although a cable from London states that in an interview with Col. Grant Morden the latter says the steamship company will closely co-operate.

Any appendage to the amalgamation of the two big steel concerns will be a source of disappointment to many in the street here, who had hoped that the two enterprises would work alone, their merging having been advocated for years.

---

Possibly the greatest feat in the history of the telephone took place a few days ago when a man in Ottawa called up a friend in Vancouver. The call was routed via Montreal, New York, Chicago, San Francisco and Vancouver, which is a distance of about 4,500 miles. This has been made possible as the result of the scientific research of the past quarter century.

### INTERESTING CATALOGUE

The Mason Regulator and Engineering Co., Ltd., Montreal, P.Q., have issued a new catalogue of their products. Every means of condensing the information has been adopted and the data have been made short and concise as possible. In other words it is a condensed catalogue. Should a reader of the book desire further information he is told how to secure it from the larger specialized catalogues published by this firm.

## Engineering

Tenders will be opened on March 1 for the erection of the proposed new palatial hotel at Windsor, Ont., for the Border Cities Hotel Company.

W. Davidson & Co., 188 Duke Street, Toronto, have received the general contract for repairs to factory for Burgess Mfg. Co., 35 Brant Street, Toronto.

A factory will be erected at Welland, Ont., by the British-American Drug Co., Ltd., which recently incorporated under a provincial charter with a capital of $300,000.

Tenders will be called in March for the erection of factory, estimated to cost $25,000, for British Columbia Impermeaite Co., Ltd., Seventh Avenue West, Vancouver.

The Baltimore Drydocks & Shipbuilding Co., Baltimore, on February 17 cut the wages of 3,000 of their 4,000 employees. The cut amounted to approximately 10 per cent.

The F. R. Dingwall Co., Winnipeg, Man., are erecting a warehouse on Albert Street. Carter-Halls-Aldinger Co., Ltd., Union Bank Bldg., have secured the general contract.

Tenders are expected to be called shortly for the erection of hotel, theatre and stores, estimated to cost $125,000, for the Peninsula Hotel and Amusement Co., Ltd., St. Catharines, Ont.

John Hayman & Sons, 432 Wellington Street, London, Ont., have received the general contract for erecting an addition to factory costing $35,000 for E. Leonard & Sons, York Street.

Plans have been prepared by F. S. Mallory, architect, 164 Bay Street, Toronto, for warehouse to cost $14,000 and addition to garage, $3,000, for Lake Simcoe Ice Co., corner Jarvis and King Streets.

## Incorporations

Graveline and Kennedy, Ltd., has been incorporated with capital stock of $150,000 with head office at Quebec City, to carry on the business of wholesale and retail importers and exporters of sporting goods generally—bicycles, motorcycles, automobiles, etc.

Brydges Limited, with capital stock of $100,000, head office at Montreal, has been granted incorporation to carry on business of iron masters and of manufacturers and rollers of steels and iron, into any and all forms.

Sumbling Machinery Co., Ltd., with capital stock of $1,000,000, has been incorporated with head office at Toronto, to carry on the business of manufacturing, buying, selling, repairing, etc., of washing machines, ironers, and all kinds of laundry and other machinery.

## Trade Gossip

**Big Season's Work.**—It was announced on February 19, by Mayor Church, after a conference with Finance Commissioner Ross and Chief Engineer Cousins of the Harbor Commission, that they hoped to do between two and three million dollars worth of work on the Toronto Harbor during the coming season.

**Change in Business.**—Announcement is made to the effect that the Cincinnati Milling Machine Company has become financially interested in the Cincinnati Grinder Company. It is purposed to manufacture the latter company's line of universal and plain cylindrical grinding machines and internal grinding machines in the plant of the Cincinnati Milling Machine Company. The latter company has recently made extensive plant additions.

**Gravity Carrier Company.**—At a meeting of the shareholders of the Matthews Gravity Carrier Company at Port Hope, it was shown that the past year had been a satisfactory one, and that prospects for the future were good. Mr. F. P. Moore, of Ellwood City, Pa., occupied the chair. The following officers were elected: President, F. B. Moore; vice-president, O. C. Sylvester; treasurer and managing director, L. O. Sylvester; secretary, A. Richly.

**A New Section.**—A new section of the Montreal branch of the Canadian Manufacturers' Association to be known as the "Steel and Iron" section has been organized. It is stated that there were over 150 firms in Montreal engaged in the manufacture of iron, steel or machinery and other metallic goods, and it is expected that this branch will eventually become one of the most important in the local organization. Steps are also being taken to organize other sections, including the dry goods, electrical apparatus, leather goods and foodstuffs trades.

**Run Open Shop.**—The Robert Mitchell Co., Ltd., 64 Belair St., Montreal, who have been making heavy castings in their foundry for the last five years, have made some new installations in their plant during the last year and are now operating on a new basis and specializing in a jobbing shop business in high-grade, light, soft iron castings. Amongst the improvements in their plant is the installation of seven Arcade air squeezers and an overhead trolley. A notable change in policy of this company towards their employees is the announcement that since the foundrymen's strike of May 1st last they have been operating on an open shop basis, replacing their former policy of the closed shop, which had always been in force in this plant.

## 27 NEW FIRMS IN HAMILTON IN 1920

**Report of Industrial Commissioner Shows That Progress Has Been Quite Marked**

Industrial Commissioner Kirkpatrick has presented his annual report to Hamilton Board of Control. New industries with capital of $7,440,000 were located during the year. The following is the list:—

Canadian Libbey-Owens Sheet Glass Co., sheet glass.
Electric Material & Products Co., electric lamps.
Peterson Core Oil Co., oils and chemicals.
Canadian Nathan Co., brass goods.
Maple Leaf Milling Co., flour and feed
W. D. Shambrook & Co., aluminum ware
Tresidder Bros., Ltd., paper boxes.
Canadian Sidecar Co., sidecars.
Sapon Soap Co., Ltd., soaps.
Mortimer & Richmond, soaps.
Malone & Morley, ice cream cones.
Canada Color Type Co., embossed enamelware.
Don-O-Lac Co. of Canada, shellacs.
Canadian Metlskin Co., boiler room supplies.
Hamilton Soap Co., soaps.
Candy Specialties, Ltd., candies.
Hamilton Pleating Co., pleated goods.
Motor-Meter Co., motometers.
Never Fail Products, sheet metal products.
Orange Crush Rolling Co., soft drinks.
Hamilton Aluminum Co., aluminum.
Spinning Mill for Canada Cottons, Ltd.
Wire Products Mill for Steel Co. of Canada.
Pocock Manufacturing Co., flat rods.
Taylor Brasco Co., Ltd., store fronts.
Imperial Oil Co., divisional headquarters
Canadian Line Material Co.

## SCRAP MARKET STILL VERY QUIET

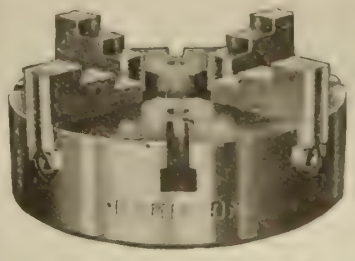
**Dealers Claim They Can't Afford To Either Go In To Buy or Sell**

The scrap metal market remains where it has been for some weeks, in the dumps. The market for yellows appears to be very narrow. Estimates have it that there are 400,000,000 pounds of copper in the United States market just now, and this cannot possibly be marketed for a good many months to come.

Dealers are in the peculiar position of not being able to either buy or sell, claiming they can't afford it either way. The stock they are holding was, for the most part, taken in at a much higher price than could be secured for it today, hence they feel they cannot afford to sell. On the other hand, they are afraid of prices, although they are low, and for that reason claim they cannot afford to buy. So there the matter stands.

Many of the yards are not making expenses, in fact some of them are taking losses every day they are in business at the present.

## CANNOT CANCEL THE ORDER HERE



**Cutler-Hammer Mfg. Co., Announce a Reduction and State Their Policy**

Cutler-Hammer Mfg. Co., of Milwaukee, have sent out the following notice:—

"Please be advised that an approximate 10 per cent. reduction of all controller prices has been effected as of February 14th by a change in discounts.

"All orders received bearing date after February 14th will be shipped at the reduced price. All orders now in the house will be shipped at price in effect at time of receipt and will not be subject to cancellation."

The briquette plant at Bienfait, Sask., which is subsidized by the Manitoba, Saskatchewan and Federal Governments, will begin manufacturing briquettes early in May, it was announced. The buildings are completed and only a little additional machinery remains to be installed. Several tests will be made before the briquettes are placed on the market. The plant was built at a cost of $500,000.

DOMINION CHUCKS

STEEL OR CAST-IRON BODY
BUILT FOR HEAVY DUTY

All Screws Are Reversible

SCREWS are made of the best grade steel. Both ends are broached and are heat treated after machining. They are reversible, so that either end may be used, are large enough in diameter to stand the torsional strains applied by operator when setting up his work. They are made to give the best service—and may be depended upon to stand up under the hardest usage.

# MACHINERY AND SUPPLIES

**All Your Requirements Promptly Filled**

Think of PETRIE when in need of machinery and supplies. Immense stocks! Quick and efficient service! Fair dealing. Contracts of any size handled with dispatch.

We have a staff of experts developed and retained to give advice on machinery problems. Consult them freely. You'll find their advice valuable and authoritative as well as prompt.

**Canada's Dependable Machinery and Supply House**

H. W. PETRIE, LIMITED TORONTO and HAMILTON

# PETRIE

# Says a Reader of Many Years Standing:

"I do feel that your paper is the most interesting and readable financial journal published in this country and, perhaps, in the entire North American Continent. Each week I somehow find time to read every word of it—mostly in bed, late at night. I find I have to read THE FINANCIAL POST in order to maintain myself properly abreast with the bigger things and movements taking place in this country."

THE FINANCIAL POST is published for men who are interested in big things—not necessarily men who personally have big financial interests at stake, but for men who are eager to know what is happening that will have a bearing on business and the well-being of Canada generally.

THE entire editorial organization of the MacLean Publishing Company is at hand to co-operate with the editors of THE FINANCIAL POST. Specialists in many businesses write for THE POST. A practical farmer, in constant touch with the farming conditions, deals with crop prospects.

THE POST is a paper edited by specialists for business specialists.

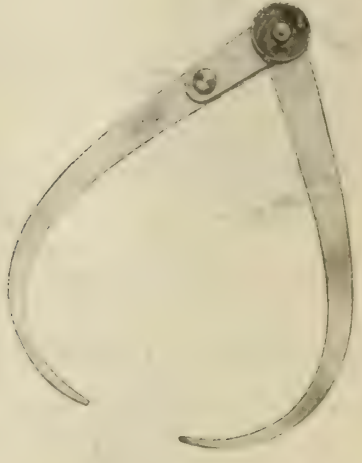
# Is the Tool He Should Have in Your Kit?

Among the seven outside calipers of Starret make there is one designed especially for obtaining measurements where the tool must be placed over a flange or inside a chambered cavity such as that shown here.



Lock-Joint Transfer Caliper No. 36—the tool that should be used here — may be removed and replaced without losing the size calipered.

See if it is included among the tools in your kit. It is described in Catalog No. 22 "3."

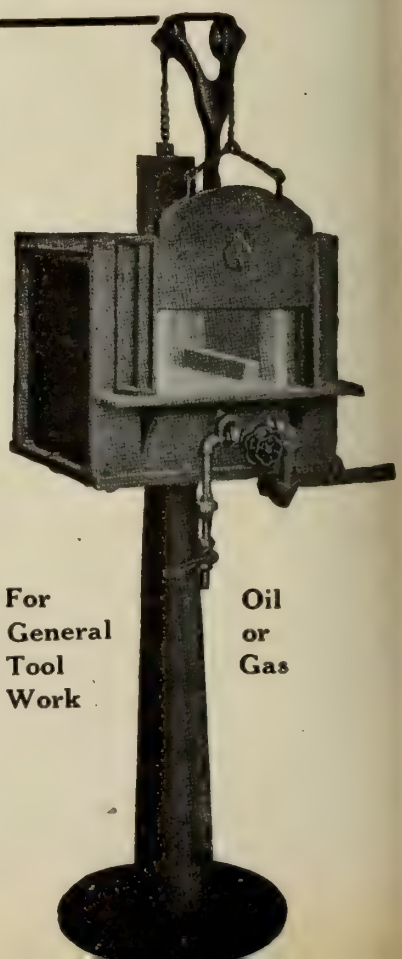
# Heat Under Accurate Control

Here is an important factor in the heat treatment of metals. An intense heat, rapidly developed, and always under accurate control of the operator, is a feature that distinguishes

# BELLEVUE FURNACES

These tool forges are particularly adapted for the requirements of the small machine shop for annealing and tempering dies, cutters, reamers, etc.

Combustion is perfect and no flames come in contact with material. Built to stand the highest temperature. Doors are properly counterbalanced. In every way BELLEVUE FURNACES meet with the demand for durability, efficiency and convenience.



**Let us advise you about your heat-treating problems**

## Bellevue Industrial Furnace Company

# HENDEY

That a cheerful worker is the more capable, the more efficient, few people will gainsay.

Nothing cheers a skillful machinist like a first-class machine—a machine whose every operation is an irresistible appeal to his pride.

Hendey Lathes, Shapers and Millers have long been the ideal of those machinists whose experience has taught them just what each machine will do.

If you investigate the Hendey—Hendeys will be your choice.

# COLUMBIAN

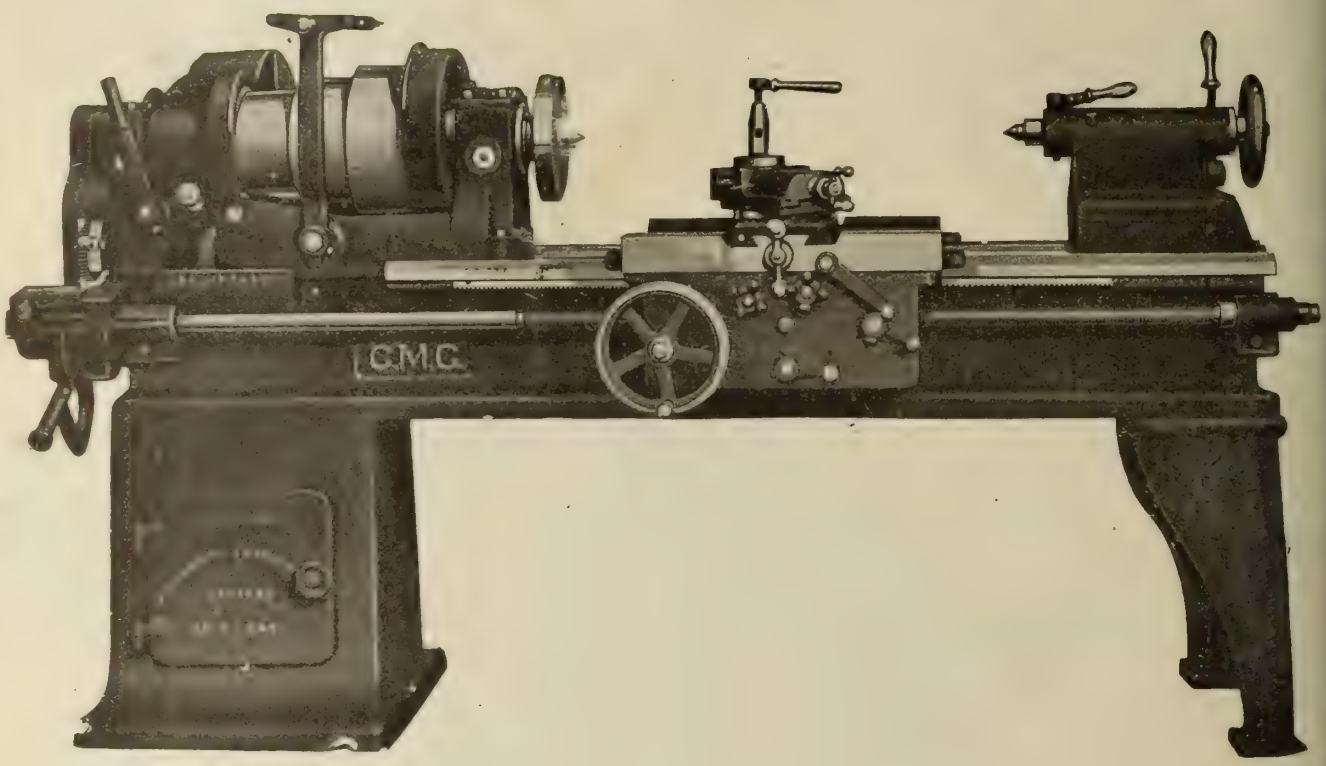
## Sledge-Tested VISES

## Will Your Vise Do This?

NO one expects a vise to be made with micrometer accuracy. Yet the jaws of this Columbian Sledge-Tested Vise are so nearly parallel that when two steel balls of equal size are placed in the vise the minimum compression required to hold one ball will be just enough to hold the other.

This particular vise has smooth jaw facings, which makes the test more difficult than with the roughened jaws which are used on all Columbian Vises of machinists' type.

Of course, this is an unusual test for a tool with a tolerance of .002″ and it is likely that out of the hundreds of thousands of Columbian Vises in use the world over, there are some that will not easily stand so rigid a test, but the majority of Columbian Vises will.



Skilled mechanics demand the Columbian Vise for exacting work. The extra large, carefully fitted beam not only keeps the jaws parallel but slides freely and without play.

Columbian machinists' vises are the only malleable iron vises made and are twice as strong as cast iron. The famous Sledge-Test proves this.

# 16" x 6' Quick Change Gear Engine Lathe

Extra power is a large factor in the success of this lathe. More power means heavier cuts and a saving in time and labor on many jobs.

All danger in connection with shifting belts is removed by the special belt shifter on the headstock and corresponding shifter on the countershaft by which the belts are quickly and safely manipulated.

P & W

# Pratt & Whitney Taps

**"With the 'Con-eccentric' Land"**

P & W Taps are **good** taps—easily the best where accuracy and high speed are essential. They cost more to buy, but less to use than others.

If you're doing work that calls for big production and for unusual precision, give them a trial. You'll be back for more when you see them prove themselves.

The "con-eccentric" land—the special feature of Pratt & Whitney Taps, permits sharpening on face of the cutting edge without affecting size. It lengthens life and assures accuracy hitherto thought impossible in a commercial tool.

# Machining Delco Generator Frames

The photograph above shows a tool set-up on a Steinle 24-in. Turret Lathe for turning out Delco Generator Frames at the plant of the Delco Light Company of Dayton, Ohio.

The chucking fixture revolves in a steady rest and is equipped with centering and stop pins for centering and locating rear end of frame by pulling sleeve collar forward. Set screws hold the front end in place. The turret fixture is reinforced in the machining operation by the overhead bar support; thus preventing undue chatter or jar under the heavy cuts taken.

This is only one of a number of installations in plants manufacturing electrical equipment where the Steinle is called upon to produce various parts from castings, forgings or bar stock.

In view of present manufacturing conditions it is invariably performance that counts and the Steinle qualities of accuracy, speed, ease of operation, power, reliability and economy of upkeep are guarantees of satisfactory performance on your own work.

**Material—Cast Steel**

**Finish—Bore, Counterbore, Face Bottom, Face Lugs**

**Time—25 Minutes Each**

***Why not send us your blueprints if your requirements call for the installation of equipment o this character? We shall be glad to furnish you with production and tooling estimates, or to have a qualified representative call and take up the question of Steinle methods as applied to your production problems.***

# IMCO TOOLS

## "The Thinker"

The purchasing of tools is a serious matter. A slight difference in the "possible efficiency" will make a considerable difference in the ultimate cost of your products. The law of averages has involved an average cost for almost all work. If your costs come below that average in your drilling, reaming and milling, consider your advantage over competitors!

The thinking buyer considers carefully the merits of every tool on the market, tests each on his own work—and abides by the results.

Catalog of "Imco" 3 and 4 lip drills, reamers and milling cutters upon request.

# An Acid Test of Quality is the Repeat Order

IT is a significant fact that in most Canadian mines, shipyards and industrial plants, where careful performance records are kept, Canadian Ingersoll-Rand Compressors have become "standard equipment."

Starting ten, fifteen, or perhaps twenty-five years ago, with one of our old "Rand" compressors, new machines have been added to meet the increased demand for air and, as a result of the good service rendered by the original machine, later additions have been of our make.

Our experience in compressor building has been so varied and extensive that it qualifies us as leaders in this line of manufacture and has enabled us to place before the compressor buyer a line of machines that will meet every need efficiently and economically.

# MAPLE LEAF
## MOTOR TRUCKS

***Built Like a Bridge***

It's not merely an accidental resemblance between the rear-end housing of a Mapleleaf Truck and the tremendous ruggedness of a steel bridge. The Mapleleaf rear axle is designed to carry heavy loads with as much indifference as a big bridge does.

The axle shafts are of the same big, husky design. They are made of the strongest steel alloy known, and revolve in the wheel on roller bearings.

You ought to see this axle. You will have a great respect for the truck of which it is a part.

**Mapleleaf Manufacturing Company**

*New Truths and Old Fallacies*

# Hardness of Alloys—*Continued*

Referring again to the test made by Professor Robert H. Smith, concerning the hardness of Magnolia, he said: "The longer the Magnolia bearing is used, and the more severe the duty imposed on it, the better becomes its condition."

When these tests were made by Professors Smith and Goodman, it is questionable whether either of them had considered the fusibility of alloys as affecting the values, but Professor Smith specifically says that he found Magnolia much superior to either Babbitt (Genuine) or Gun Metal (bronze).

The mention of bronze reminds the writer of an incident related to him by Mr. F. L. Johnson, once Associate Editor on "Power" and previously for many years a practical operating manager of large plants. When he was in charge of the Baltimore Copper Works a delay occurred in delivery of bronze bearings for the rolls. Without consulting him a supply of Magnolia was sent to tide over this critical period.

As there was no help for it, he poured the Magnolia bearings and then waited around for the expected trouble. To his great surprise the Magnolia lined bearings ran cool and far surpassed the bronze bearing in wear, and from that day he never used any metal on any bearings other than Magnolia, when he could get it.

Such demonstrations of Magnolia's capacity to sustain heavy loads and without injury, do not happen from chance. Magnolia is not only sufficiently hard, but is protected by its other qualities from heating and rapid wear on bearings, which are destructive to most babbitts.

Magnolia also favors adjustment to any inequalities of bearing or shaft, thereby distributing the load uniformly over the entire surface.

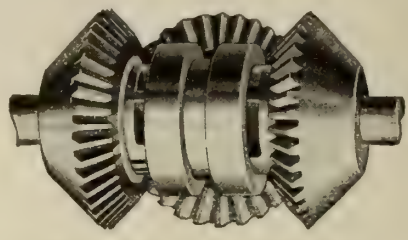
# THE JOHNSON FRICTION CLUTCH

## Clutches for Reversing Functions



Johnston Clutch Installation on a Newton Milling Machine

A reversing clutch is a very common requirement on machinery, and one which is encountered in many different forms. Whatever the situation may be, a Johnson Clutch offers the best method of handling it.

The bevel gear assembly shown here is one of the ways in which a Johnson Double Clutch is frequently applied for reversing functions. Many of the best machine tools are equipped in this manner.

# Monel metal for superheat

HIGH machine speeds, constantly increasing demands on already installed steam lines, have forced power plants to superheat.

Commonly used "steam" metals cannot survive the chiseling attack of steam, superheated and under high pressures. So leading designers specify Monel metal.

Monel is used for guide stems, wedges, seat rings, spindles, pistons, etc., in great valves built by Chapman, Crane, Jenkins, Lunkenheimer, Nelson, Pratt & Cady and others equally prominent. It is used as blading, poppet valve parts, etc., in large steam turbines.

In power plant condensing and auxiliary apparatus Monel is used as meter parts, valve trim, pump rods and liners, etc. For only Monel combines the strength of steel with the ability to withstand the combined chemical and mechanical attack of high pressure and superheated steam, most acids and alkalies. Steam wear and water slippage is reduced to the minimum, machine life is lengthened, service is uninterrupted by costly shut-downs and expensive repairs.

Monel is being rapidly adopted for service calling for acid, alkali, high heat and steam wear resistance. It has a prominent place in the specifications of the largest engineering organizations in the country.

**The International Nickel Company of Canada, Ltd.**
**Harbor Commission Building, Toronto, Ont.**

The name Monel identifies the natural nickel alloy—67% nickel, 28% copper and 5% other metals—produced by The International Nickel Company. Monel products include Monel blocks, Monel rods, Monel castings, Monel sheet, Monel wire, Monel strip stock, etc.

## Vitrified
### Grinding Wheels

These wheels are the most generally used and give the greatest satisfaction for the majority of grinding jobs, since the bond is less affected by heat and may be used wet or dry. The Vitrified process affords a wider range of grades, the wheel is more open in texture and more free-cutting. It takes from 20 to 30 days to carefully manufacture a wheel by this process.

## Silicate
### Grinding Wheels

Silicate Wheels may be manufactured in 24 hours. They are often substituted for Vitrified wheels when it is inconvenient to wait the longer time required to manufacture wheels by the Vitrified process. These wheels derive their name from the large portion of silicate contained in the bond. We manufacture Silicate wheels with or without web as specified by the customer.

# CANADIAN HART WHEELS

*Made-in-Canada*

IN ALL grinding, the main problem is found in the dissipation of the heat generated. A wheel manufactured of proper abrasive grains, of a proper degree of hardness, will produce a minimum of heat, and this heat will be dissipated with the least injury to the wheel or material ground.

Once you find the correct grade and grain, you want to feel **sure** that **every** future wheel you order will give the same satisfactory service as the first.

The unvarying uniformity of Canadian Hart Wheels is a recognized fact which more and more shops are coming to depend upon. **Why not you?**

***Tell us what you have to grind***
***and we'll tell you the wheel to use.***

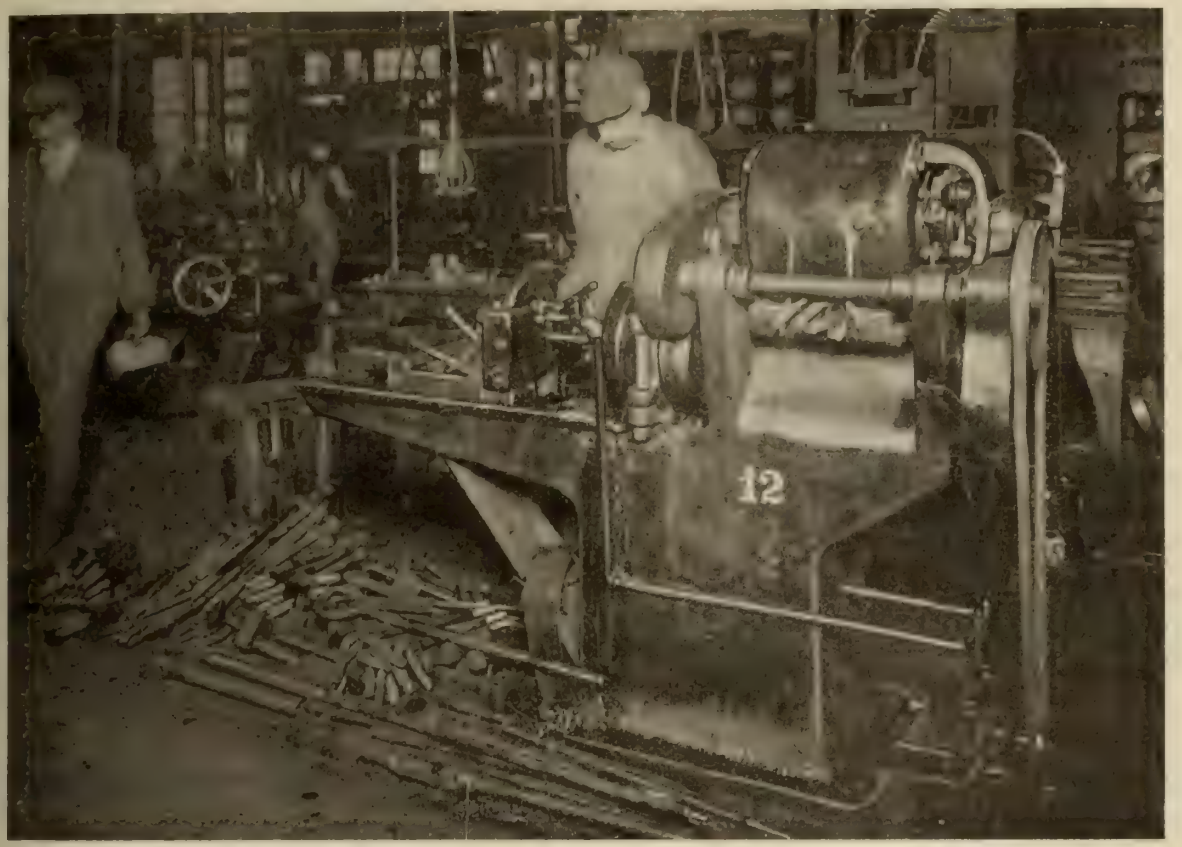
# Correct Lighting in your Plant means More Work and Better Work

## Let Us Ease the Eye Strain



Good lighting is a factor of first consideration in any effort to improve workmanship, increase production, reduce spoilage and safeguard employees.

A poorly lighted plant breeds weariness and discontent, resulting in uneven production and waste. Ease the eye-strain and get more and better work from a happier staff by installing a correct Industrial Lighting System in your plant.

Our Illumination Engineers will gladly help in solving your particular lighting problem by planning the system that will most efficiently and economically meet your need. Such well-known names as Benjamin, Adams & Bagnall and Overbaugh and Ayres are included in our stocks of Illumination Equipment.

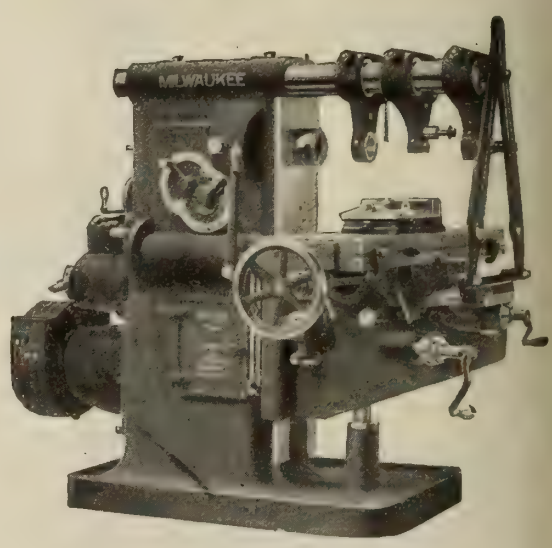
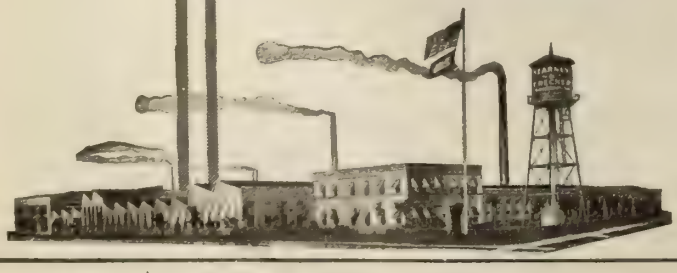
# MILWAUKEE MILLING MACHINES

## Increase Your Dividends



**Economy and increase in quality and production of work follows the installation of—**



## Milwaukee
### Milling Machines

ECONOMY—greater economy—is the demand of the day. It will surprise you how profitably and economically the Milwaukee Milling Machine will do your milling.

"Milwaukee" engineers' forethought in superior design and construction, together with actual accomplishments, are responsible for the unprecedented choice of Milwaukee Milling Machines by leading manufacturers throughout the world. Unquestionable dependability to economically and efficiently meet the demands of production milling or work varying widely in character has won for them a memorable place in the hearts of discriminating mechanics and manufacturers.

Let us show you how you can cut your milling costs and increase your dividends. Permit us to send our catalogue as a forerunner.

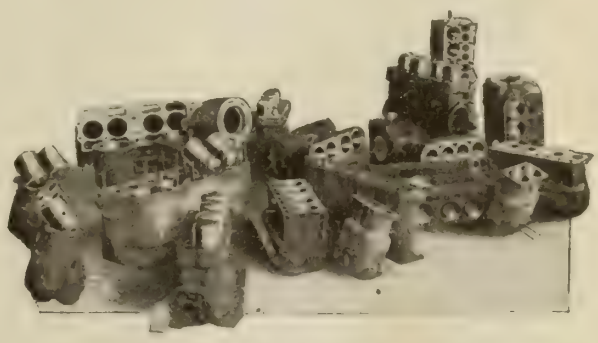
HEALD

# New Business Possibilities

A real regrinding machine. See how easily it handles a six-cylinder en bloc.

## Regrinding Cylinders



*Saves Gas*
*Saves Oil*
*Gives More Power*
*Stops Smoking*
*Owners Demand It*

Whether you are already interested in automobile repairing or are seeking some profitable business to go into, be sure to consider the regrinding of motor cylinders. Here is a new field of opportunity that has been barely scratched. With some thousands of registered cars that are being overhauled and whose worn and scored cylinders will require regrinding to bring back the original power, pep and economy of a new car, the possibilities are unequaled in any other business at the present time.

The Heald Style No. 55 has been just put on the market for this work. The capacity and range is such that it will handle all sizes and styles of cylinders usually found in the regrinding shop. It can be bought at a fair price, easy to set up, simple to run and maintain, with a capacity that will give you jobs you never planned on.

**Some one in your vicinity is going to buy a Heald and get the cream of a profitable business.**

**Are you the one?**

Handles all sizes and shapes of cylinders.

# LARCUL CUTTING OILS Did the Trick

A large manufacturer of fittings recently had some malleable iron unions that were so hard they had to be annealed before they could be properly threaded.

The superintendent was very pessimistic and did not believe that any kind of cutting compound would keep his tools in shape to machine these castings. We assured him that Larcul Ebony and Amber Cutting Oils would "do the trick," and his letter to us proves that they did!

> "Machined up all the unions that we used to send back to be annealed and they were as hard as flint, and I never believed there was an oil made that would touch them until you sent us those oils and we cleaned up all the unions we had on hand which were giving us a great deal of trouble and the threads were as good as we are getting on our regular run of castings."

Larcul Cutting Oil is made in two grades: Amber, a transparent oil, for all types of automatics, turret machines, gear cutters, etc., and Ebony, for pipe and bolt threading, nut tapping, turrets, automatic turning and boring, etc.

Larcul makes the "impossible" job possible, and the regular job easier.

*Let us give you a demonstration.*

Franklin Die-Castings in Office Appliances

## *The Growing Needs of Business*

Not long ago the steel pen was practically the only mechanical instrument used in transacting business. To-day typewriters, telephones, multigraphs, adding machines, filing cabinets, billing machines, stamp affixers and an ever-increasing list of other appliances meet the growing needs of business.

The Die-Casting Process is prominent among the manufacturing methods that have made possible this extraordinary development.

In 1892 we originated the Die-Casting Process, and for nearly thirty years we have been applying it to many fields of industry. Our long experience should be of value to progressive engineers.

We cast in Aluminum, Tin, Lead, and Zinc base alloys, and quote from samples or blueprints.

MORTON

# Increased Driving Box Repairs Forced the Purchase of this Morton Draw Cut Shaper

Delays to output were traced direct to driving box repairs in this busy shop. Time element and shortage of man power were considered and the installation of this "Morton" reflects the good judgment of these thoughtful officials to install machines of guaranteed production power.

This Morton handles all the machine work on driving boxes—planing to thickness, planing shoe and wedge faces and crowning for bearing brass. It simplifies handling and reduces machine time.

May we send Bulletin A-6 explaining numerous points of merit?

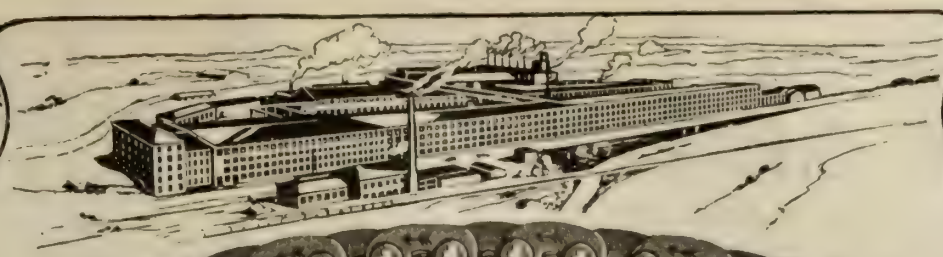
# Dominion Oxygen

## *when and where you want it*

FROM four centrally located points the Dominion Oxygen Company, Limited, supplies Canadian industry with the commercial oxygen it needs. Thanks to the completion of these first four distributing stations, Canadian manufacturers can now rely on a never-failing source of immediate oxygen supply.

*Delivery of pure oxygen in any quantity, at any point, at any time, is made certain by Dominion's producing and distributing organization.*

The manufacture of uniformly pure oxygen in quantities large enough to insure prompt attention to your needs has been the aim of the Dominion Oxygen Company, Limited, since the formal announcement of its building plans. The fact that every order for oxygen is filled on the day it is received is evidence of the efficiency already reached.



Dominion Oxygen Service is based on the Company's realization of Canada's need of an always available supply of uniformly pure oxygen. Dominion oxygen, in the high capacity cylinder built for economical and safe handling, fills that need.

SHEPARD
ELECTRIC CRANES & HOISTS

## With ease and precision

A Shepard Electric Traveling Crane will pick a tonnage piece and quickly convey it to any part of the bay.

Shepard cranes and hoists are installed to meet the peculiar needs of individual shops and factories. Shepard engineers offer their services in designing the equipment which will most efficiently and economically handle your material.

Electric Cranes 1 to 50 tons; Electric Hoists ½ to 30 tons; Electric Winches and Cargo Handling Equipment for Docks and Ships.

The Shepard is thoroughly lubricated; and tight metal housings encase the operative mechanisms, eliminating dirt, dust, dampness, and fumes.

LANDIS

# 100 Per Cent. Production

THE New Landis Piston Grinding Machine meets both essentials 100 per cent. strong.

A brief summary of the principal features and what they accomplish in better pistons and greater production:

Cylinder part and relief, ground complete without removing from the machine, insuring concentricity of all grinding operations. Work practically remains in plane with grinding wheel centre at all times as the work swings directly over the fulcrum point. A number of different sized or shaped cams can be placed in attachment at the same time, thus enabling different shaped pistons to be ground with slight adjustment.

Universal driver furnished with each attachment, facilitating round and accurate work.

**Write to-day for complete description.**

# Automotive Industry Watching Costs

IT TOOK a price reduction to "sell" automotive manufacturers on the idea (which they all know in the backs of their heads) that when you can't make a profit by increasing or maintaining prices—you can still make a profit on reduced prices, by

1. **Watching costs.**
2. **Increasing production (which is the same as lowering overhead per unit).**

What a crisis showed one group of manufacturers, can be adopted to the advantage of other manufacturers (without the crisis, perhaps) if they will profit by the experience.

GTD has maintained and proved by many experiences that in the work of screw-threading, GTD tools, particularly "*Gun*" Taps, "*Acorn*" Dies and GTD Gages, reduce costs and increase production.

*We will gladly supply you with details regarding these GTD tools. Just clip the coupon and send it in. No obligation, of course.*

### This is the "*Gun*" Tap

Its features are a shearing cut—no chips to clog flutes and break tap — shallow flutes giving great strength —requires one-half power necessary to drive ordinary

tap — cuts true to size until ground down to last three or four teeth. The "*Gun*" Tap will outlast two or three ordinary taps, and *wears out before it breaks.*

### This is the "*Acorn*" Die

It has a positive, concentric adjustment on all cutting lands, making it practically a solid die, and insuring great accuracy. By means of its various holders, it is adapted to

all kinds of machines using threading dies, lathes, drill presses, hand or automatic screw machines, turret lathes, bolt cutters, etc. Its life is many times that of the ordinary die.

### GTD *Gages*

There is only one standard inch. The U.S. Government sets that standard — **GTD** gages accurately reproduce it. A certificate of the Bureau of Standards will be furnished with any of our gages, when requested. **GTD**

manufactures both thread and cylindrical gages and designs complete gaging equipment for any product. **GTD** gages increase production and lower costs. Our gage experts are always at your service.

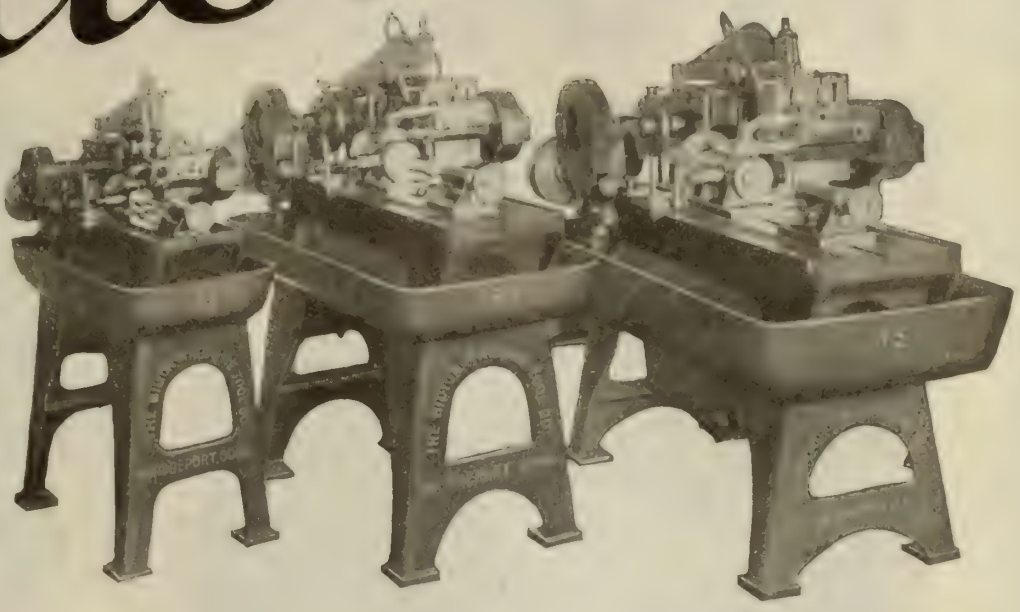
TRAHERN

## Better Threads

One of the vital necessities for cutting clean and accurate threads, is a steady stream of coolant kept flowing upon the chasers of the die head. The coolant gives longer life to the chasers, keeps them cool, and makes threading much easier.



But a dependable circulating pump is necessary to assure a steady flow of coolant.

Trahern Rotary Geared Coolant Pumps are furnished as regular equipment on leading machine tools to-day. They throw heavy, forceful streams entirely free from pulsation. Supply can be shut off at discharge without stopping the pump, assuring the right quantity of coolant at the proper time. Will pump water, oil or compound. Operate at low speed, guaranteeing long life. If necessary will work against 100 lbs. pressure. When properly installed, guaranteed not to lose their prime.

For high quality threads, equip your machines with TRAHERN Pumps. Our catalog No. 44 explains in detail.

**TRAHERN PUMP DIVISION**

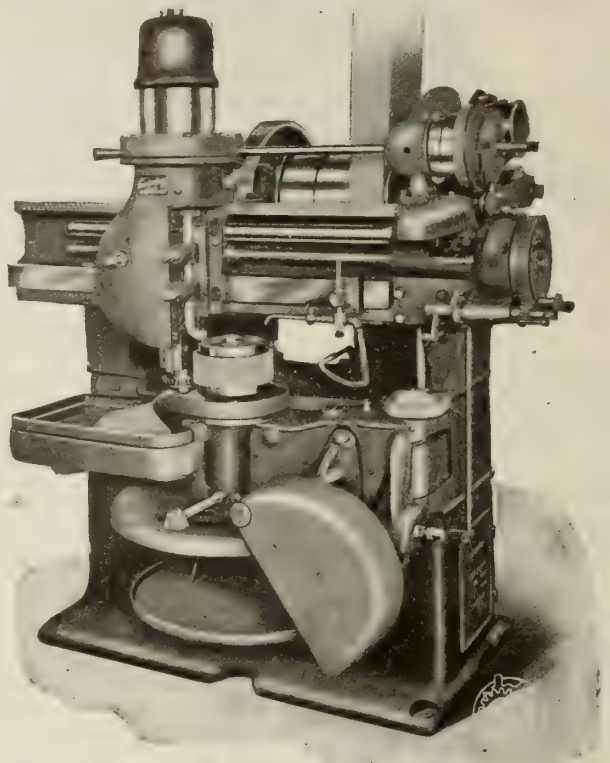
# Gear Cutting With the "IFS" Left Out

## The Gear Shaper Way

A production manufacturer knows that he will secure good gears IF he has an accurate cutter, an accurate machine and a machine working on the correct principle. The whole question of good gears is resolved in this one little word "IF."



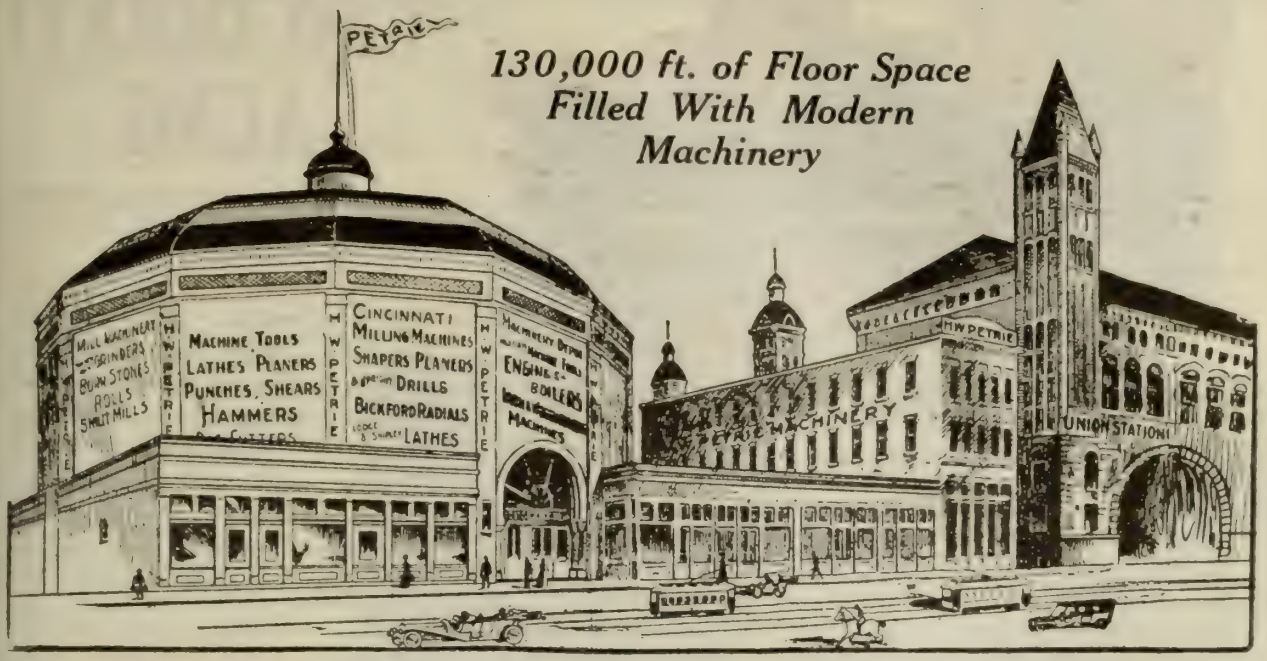
When the Gear Shaper was originally designed, the question of "IF" was taken into consideration and every possible means known to mechanical engineering was employed to eliminate the "IFS" from gear cutting.

That we have been successful in solving the problem is evidenced by the fact that each ensuing year sees a larger number of manufacturers adopting the Gear Shaper method.

How the Gear Shaper has accomplished this is clearly explained in our general catalog "Commercial Gear Cutting," which is a treatise on the subject of:—

Gear Cutting with the "IFS" Left Out.

**Send for your copy to-day.**



The Fellows Gear Shaper—the machine which has taken the "IFS" out of gear cutting.

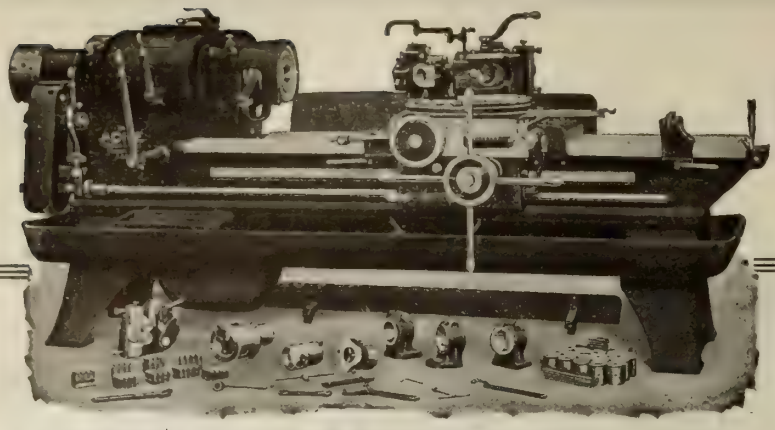
*130,000 ft. of Floor Space Filled With Modern Machinery*

# PAY US A VISIT

## WHEN IN TORONTO

If you would like to see the largest exhibit of machine tools in Canada, pay a visit to our warehouse the next time you are in Toronto. No trouble to find our place. It is situated next door to the Union Station. Here we have 60,000 feet of floor space devoted to metal-working and woodworking machinery of all kinds, in addition to supplies and power transmission machinery.

Then there is our annex at the corner of Niagara and Bathurst Streets—70,000 feet of floor space and 40 acres of yards here, filled with machinery that meets all demands of Canadian shops. Our warehouse space thus totals 130,000 square feet, accommodating an immense line of tools—modern tools that are worthy of the attention of all careful buyers.



This invitation of course applies to Torontonians, too. Call on us at any time. You are always welcome.

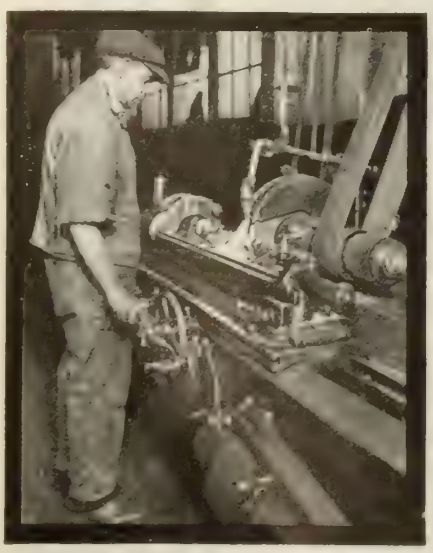
# The Grinding Wheel *and* The Gasoline Engine

**For photographs and details we are indebted to the Buda Company, *Harvey, Illinois***

Grinding Cylinder Castings, Heald Machines. Wheels are Norton Crystolon, 24-J, 3½ in. x ¾ in. x 1¼ in. Limits are plus or minus .001 in.; stock removed .008 in. to .012 in.

It is remarkable that there are few parts of gasoline engines which are not ground—cylinders, pistons, connecting rod bushings, valve heads, push rods, crankshaft bearings, pins, camshafts, and many other parts depend largely on the grinding wheel industry for efficient production and accuracy.



**CYLINDER GRINDING**—The proper grinding of the cylinder—which is the fundamental of the engine—determines the efficiency of the assembled machine. In the cuts shown, cylinders, cast four en bloc, are ground on Heald Cylinder Grinders, using Crystolon wheels 24-J —3½ in. x ¾ in. x 1¼ in. As the cylinders come from the Boring department, there is about .010 in. stock left on diameter for grinding, which is within .001 in. limits. Each machine completes twelve castings in an eight-hour day, a total of 48 cylinders.

Roughing Camshafts; Norton Machine; Norton Alundum Wheel, 24-Q 18 in. x 1¾ in. x 5 in. Camshafts are rough ground with Norton Alundum Wheels, 24-Q 18 in. x 1¾ in. x 5 in. and finish ground with a Norton Alundum 24-L 18 in. x 1¾ in. x 5 in. wheel.

**GRINDING CAMSHAFTS**—In grinding the seven different types of cams, three Norton machines equipped with Alundum No. 24-Q, 18 in. x 1¾ in. x 5 in. wheels are used for roughing, and three machines with 24 combination K, 18 in. x 1¾ in. x 5 in. wheels for finishing.

**CONNECTING ROD BUSHINGS**—Obtaining a perfect surface on the bronze connecting rod bushings, and bringing them down to size direct from the rough, is now done by grinding alone. This removes about 3-16 in. of stock, and production is 600 in eight hours, using Norton 24 Combination M, 20 in. x 4 in. x 12½ in. wheels.

VOL. XXV. No. 9 March 3, 1921

# New Universal Plate Mill

Technical Details — Construction Work—Electrical Equipment, and Various Other Features.

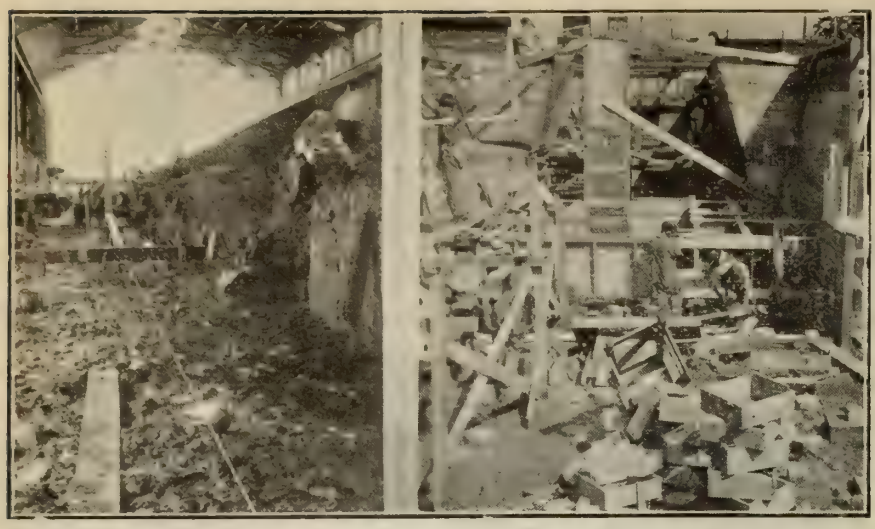
*By J. H. Moore*

THE FLYWHEEL MOTOR GENERATOR SET WITHOUT THE FLYWHEEL

THE universal plate mill just installed at the plant of the Dominion Foundries & Steel, Ltd., Hamilton, Ontario, will give Canada a mill of sufficient size to produce large plates, that heretofore have been imported through necessity. This mill, as already stated, is of the universal type and will roll universal plate from 7 inches to 41 inches, shear plate to 64 inches, and will roll both slabs and billets. At the present time all kinds of structural plates for bridges, buildings, cars, heavy pipe skelp, sheet bars, etc., are imported. These imports amount to hundreds of thousands of tons annually but the addition of this mill should help such work in our own country.

It is also intended to roll slabs and forging billets to furnish stocks for their own plow and jobbing mill, also their axle forge shop. These two departments have already been in operation for over two years. The new mill will also roll special forging billets or blooms, such as are used for locomotive, ship, and other heavy forgings. By removing the side rolls of the mill, sheared plates up to 64 inches can be rolled. It can also be equipped with blooming rolls for rolling billets, and a manipulator is installed to take care of this when used as a blooming mill.

At the close of the war this company found itself with a steel making capacity of over 12,000 tons per month; a large modern foundry; a heavy forge shop; a 22-inch bar mill; an axle shop, and a 26-inch jobbing mill. This latter mill was turning out soft center and solid plow steel, automobile frame steel, and jobbing plates, and it was realized that additional finishing capacity was absolutely necessary, not to speak of the need of equipment for the breaking down of the ingots for the existing finishing departments. After careful consideration, it was decided to install the plate mill about to be described.



The mill itself is made by the Mackintosh & Hemphill Co., Pittsburgh, and is technically known as a 27-inch universal plate mill. The horizontal chilled iron rolls are 72 inches in length, with an extreme vertical lift of 20 inches. The vertical rolls both front and back are 18 inches in diameter, and have an opening range from 7 inches to 41 inches. The rolls are operated by hydraulic pull-backs, and the screw downs on the rolls are electrically operated. The main screw downs have two 60 h.p. compound wound motors in series, while for each set of side screws, there is a 40 h.p. motor of similar type.

The housings are cast steel of very rugged proportions, and many other principal parts on the mill are made from the same material. The pinions for both the horizontal and vertical roll drives are enclosed in oil type housings, and all these pinions have machine cut, helical teeth. The main screw down motors are mounted on the pinion housing cap, while the side screw motors are located in a pit at the side of the mill.

Provision is made for removing the side roll housings and inserting a short section of driven rolls both front and back, this allowing the rolling of shear plate up to 64 inches. This system of removing the side housings is also necessary when using as a blooming mill. The illustrations shown throughout the article are taken from various positions, and the details can be noted from the underlines.

### Construction Work

It is of course easily understood that an installation of this size entails considerable preliminary construction work. Without even attempting to enter the details of the work involved, let us skim over for a moment a few figures that will show conclusively the magnitude of the task. The main building in which this mill is located is approximately 500 feet long by 68 feet wide. The tables for the mill run the complete length of the building, and reinforced concrete foundations for all these tables, shear, etc., had to be laid. Then there were the foundations for the different power plant units. All this meant considerable work, for it was absolutely necessary to trench down until good solid ground was reached. The inserted panel tells its only story in this respect. The construction views depicted illustrate a little of the work entailed, but we are making no attempt to touch this work in detail. Enough to say that the foundations are laid 14 feet down underneath the mill and of course tunnels are provided to allow workmen to attend to bolting down, repairs, etc. The amount of concrete used is surprising. Over 10,000 cubic yards of solid concrete has been laid and over 1,000 bolts have been used, these ranging from 1½ inches diameter up to 3 inches. A very notable

THE PICTURE TO THE LEFT SHOWS THE DIGGING OF TRENCH FOR TABLES, WHILE THE OTHER VIEW IS THE PREPARATORY WORK ON FOUNDATIONS FOR PORTION OF ELECTRICAL EQUIPMENT.

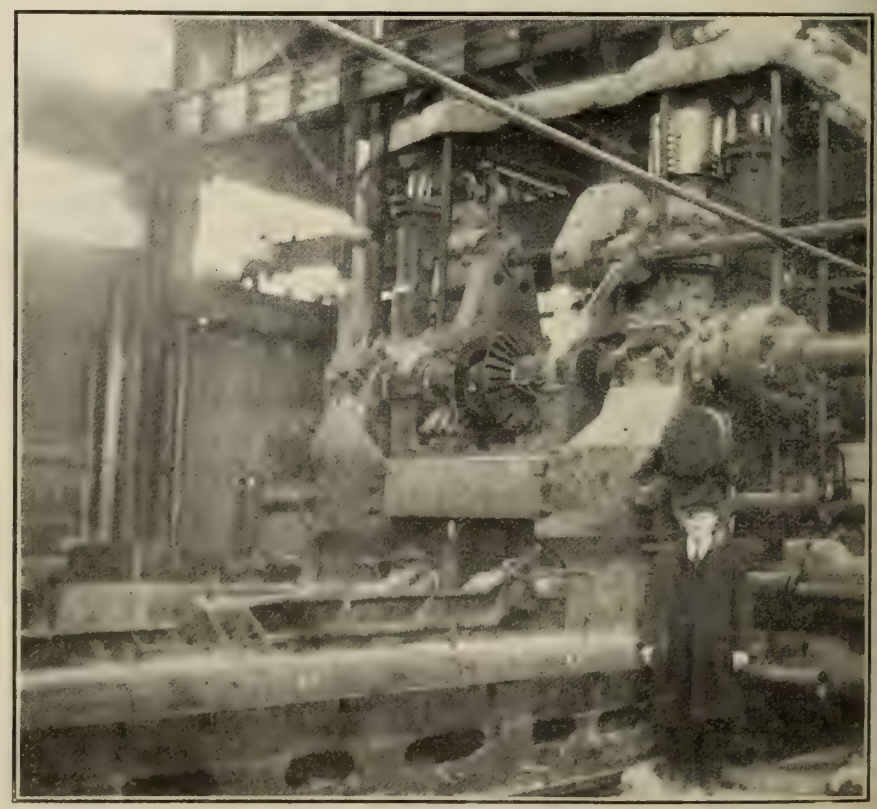
performance in continuous concrete pouring was brought to our attention, and the quantity poured is well worth repeating. In 2½ days 1,153 cubic yards were poured, this of course being for 24-hour days.

### Electrical Equipment

The mill is direct connected to a 5,000 h.p. reversing motor of the compensating commutating pole type, and is specially designed to withstand the severe service encountered on reversing rolling mill work of this nature. The speed range of the motor is 120-0-120 r.p.m., and since the speed is quite slow during a considerable portion of the time, and the momentary current peaks are high, it has been designed for forced ventilation. A Buffalo Forge Co. fan is used, this equipment being placed in a lean-to at the side of the power house.

There is also a flywheel motor generator set, this consisting of a 2,000 h.p. wound rotor induction motor driving a 50,000 pound cast steel flywheel, and a special d.c. generator. This generator is also of the compensated commutating pole type and is designed to withstand the same peak load as the reversing motor.

The exciter set is of 3 piece construction, consisting of a 7½ K.W. exciter, and a 25 K.W. constant potential generator driven by a 50 h.p. induction motor. The magnetic control, main switch board, and air washing outfit are all located in the same building as the motor generator set.



The switchboard and control apparatus is very interesting. The reversing motor is controlled automatically by magnetic switches. Adjustable relays control the rate of acceleration and retardation of the motor, so that it operates at a rate consistent with the reductions which are taken in the mill. The control is so interlocked that the motor always has full field when starting. Further increase in the speed, up to a maximum, takes place after the generator field has attained full strength.

The main switchboard controls the 2,000 h.p. A.C. motor, as well as the exciter and blower motors, and has mounted thereon the necessary meters for measuring the power of the different circuits. Two automatic oil circuit breakers are used between the power line and the primary of the 2,000 h.p. motor. One of these circuit breakers is for forward operation of the flywheel set, and the other breaker is for reversing the power to the set in order to make a quick stop when operating at full speed. This feature is included because it is sometimes desirable to bring the flywheel set to rest quickly, in case of trouble of any kind.

Between the D.C. generator and the reversing motor, an electrically operated high capacity automatic circuit breaker is used. The purpose of this circuit breaker is to interrupt the main D.C. circuit in case of very extreme overloads. The master switch is mounted in the operator's pulpit, and on an inclined panel in front of the operator is a D.C. ammeter and voltmeter for indicating the power transferred between the generator and reversing motor. This panel also has red and green lamps that indicate the position of the main circuit breaker.

The secondary of the 2,000 h.p. A.C. motor is controlled by means of an automatic liquid slip regulator. The position of the electrodes, and thus the amount of resistance inserted, is governed automatically by the torque motor, which in turn is actuated by means of a current transformer in the primary leads of the main motor. If the regulator is set for the average load on the motor during operation of the mill, it will take a constant input from the power circuit as long as the equipment is operating up to capacity. As peaks come on, the torque of the small motor is increased due to the greater current in the primary leads which raises the movable electrodes inserting more resistance in the secondary. This allows the motor to slow down, and shifts the peak to the flywheel. After the peak has been taken care of, the input to the main motor will be maintained until the set is brought up to approximately full speed.

The excitation for both generator and motor is supplied by the small exciter

GENERAL VIEW OF THE PLATE MILL. F. C. WALKER, THE SUPERINTENDENT, IS A BIG MAN—BUT SMALL IN COMPARISON WITH THE MILL.

set. The direction of the roll motor excitation is not changed during operation, but is varied to meet the conditions of load and speed requirements. The operation is as follows: With the flywheel set at full speed, and master controller in "off" position, the roll motor will not be in operation, since the generator has no field current. The motor now has full field and the generator field is gradually excited, bringing up the voltage across the motor armature which will cause the same to revolve in the direction indicated by master switch. Compounding of the reversing motor is accomplished by means of the series exciter, which is excited by the current flowing between the generator and the motor. In this way any variation in the load on the mill motor will vary its total field excitation, thus giving the effect of a compound motor without the disadvantage of reversing such heavy currents in the series winding, which would be required in machines of the usual type. Due to this system, compounding can be varied to suit the operating conditions without the necessity of shunting heavy currents.

The speed at which the roll motor runs is practically proportional to the impressed voltage, independent of load up to full field on both motor and generator. From here, the speed is increased by manipulating the field of the motor. During the pass, the load on the generator is often very much in excess of the average over the entire cycle, and the automatic slip regulator enables the flywheel to supply the difference between the average input to the set and the load on the generator during the peaks. A slip regulator automatically inserts resistance in the secondary of the induction motor when its primary current reaches the average value, so that the speed of the set is reduced, allowing the flywheel to give up a portion of its energy. When the load on the generator decreases below the average for which the regular is set, this operation is reversed, i.e., the difference between output of induction motor and input required by generator goes to bring the set up to maximum speed. By this system, the input to the set may be limited to practically a constant value, independent of peak loads which are several times the maximum load on the line.

The roll motor is rapidly brought to rest by regenerative braking if the voltage on the generator is lowered below that corresponding to the speed of the motor. In pumping back power into the set, a large portion of the accelerating energy is reclaimed, helping each time to increase the speed of the set and consequently the energy stored in the flywheel. A device for accomplishing rapid acceleration is incorporated so that when it is desired to speed up the operation the normal time for building up the generator voltage can be reduced.

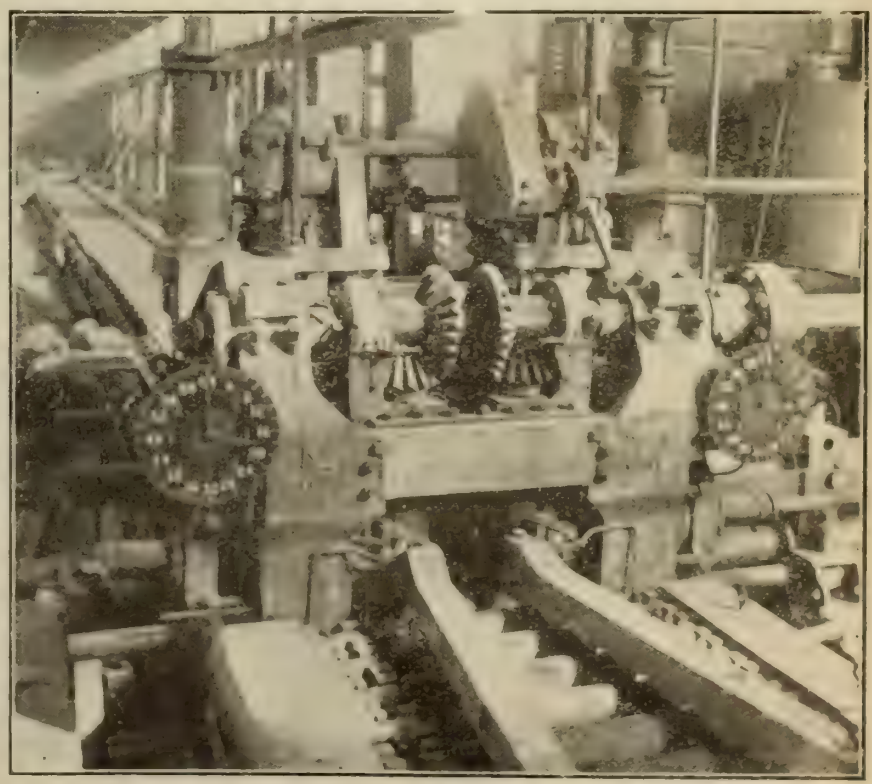
The incoming power is 13,000 volts, 3 phase, 27 cycle, and is brought through an underground cable 1,500 feet from the main substation of the company. It is transformed down to 2,200 volts immediately at the mill power house.

The power for screw down and table D.C. motors is furnished by a motor generator set consisting of a 400 K.W. generator 220 V.D.C. connected to a 590 h.p. synchronous motor 2,200 V, 3 phase, 25 cycle. This also furnishes the power for driving the D.C. motors on all tables, plate leveller, manipulator, furnace pusher, shear depressing table, pinch rollers, etc. Provision is made for installing an additional motor generator set to duplicate this when required.

### Various Details

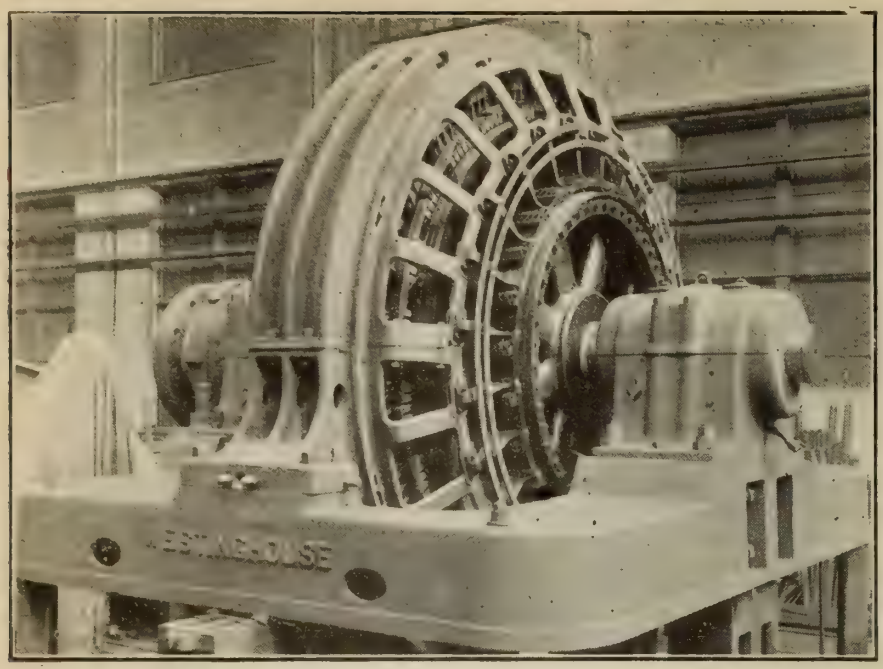
The billet shear used is of Mackintosh & Hemphill design, and was built by the Canadian Allis-Chalmers Co. The capacity of the shear is 10 feet by 10 feet square, and slabs up to 40 inches width can be cut. The stroke is 12 inches, the length of knife 48 inches, and the number of strokes 14 per minute. It is driven by a 125 h.p. induction motor and the clutch shifter is worked by a 9 h.p. D.C. mill motor with brake and limit switch. The shear gauge is also of M. & H. design, and is operated by a 9 h.p. D.C. motor.

The shear depressing table, back of the shear, is 23 feet long with 11 rolls 14 inches by 48 inches. It is driven by a 60 h.p. D.C. mill motor at a speed of



### *SOME VIBRATION*

*F. C. Walker, plate mill superintendent at the plant we are speaking of, tells a funny story about vibration. "You are, of course, well aware," he started off, "that a plate mill of any size is always subject to considerable vibration, but you have to actually experience the sensation before you have any conception as to its extent.*



*"When you stand on the pulpit, or as some might term it, the control bridge, you feel the sway to a nicety. I remember on one occasion the foundations were none of the best, and the vibration and swing was worse than usual. It was like standing on the bridge of a ship during a rather nice swell.*

*"On reaching home that night I could still feel the sway, but the limit came when I actually woke up in the night to find myself grabbing the bed post firmly in order to keep myself from falling off the pulpit."*

*The little tale about vibration may seem to the uninitiated as exaggerated, but when we consider that the firm installing this plate mill at Hamilton saw fit to have a 14-ft. deep foundation of reinforced concrete, there must be something to the story. Below the concrete again there is placed considerable piling to a still further depth of 30 ft., this, of course, being to prevent sinking. Good, firm soil must be reached before the foundation proper is poured. In the old days these were of stone, not concrete, but were never as satisfactory as the modern method. Before a foundation is commenced, the ground is carefully drilled to ascertain its quality at different depths. Having this information at hand, they can proceed to drive their piling.*

CLOSE UP VIEW OF THE PLATE MILL.

THIS ILLUSTRATES THE 5,000 H.P. REVERSING MOTOR WHICH DRIVES THE MILL.

266 feet per minute. The shear run out table is 45 feet long with 27 rolls 14 inches by 48 inches and is driven by a 60 h.p. D.C. mill motor running at a speed of 266 feet per minute.

The punch rollers are located immediately back of the shear run out table and are 18 inches by 48 inches. These rollers are for delivering skelp, etc., to the piler, the intention being to cut skelp sheet, bar, etc., on the billet shear without going over the hot bed. The speed of rolls is 480 feet per minute.

The shear equipment consists of a cut-off and two side shears with an arrangement of castor beds to serve them. A 10-ton platform scale 5 feet wide and 50 feet long is also arranged for castors.

On account of the variety of products, a diversity of heating furnaces is necessary. A 32-foot continuous furnace with douhle electric charging pusher and delivery pusher places the ingot directly on to the approach table.

The mill tables, front and back, are 35 feet long, each having 20 rolls. The 13 rolls next to the mill are spaced 17 inches, while the balance are spaced 21 inches. All rolls are 14 inches diameter, 72 inches long. The maximum speed of table is 428 feet per minute. The case, and the table beams are made of cast steel and the roll bevel gears, as well as the drive gears, are machine cut cast steel, running enclosed in oil.

Each mill table is driven by two 80 h.p. mill reversing motors, connected in series. These motors have full magnetic plugging control, and are so arranged that the motors on the incoming table work at half speed, while the outgoing table works at full speed in either direction.

The two controllers are mechanically connected, and the operator uses only one handle to operate all four motors. This is accomplished on the first point of the master controller in either direction, and on the second point both tables run at full speed.

The approach table is driven by a 60 h.p. motor. The length of this table is 70 feet and it has 35 rolls spaced 18 inches centers in front of furnaces; while the balance are spaced at 21 inches and 30 inches centers, the latter distance being at the extreme end of table. The speed of this table is 350 feet per minute. There is also an extension to the table, this being 55 feet long, but with no rollers.

The run out and hot bed tables are each 145 feet long, the former having 58 rolls and the latter 61. These rolls are 14 inches diameter, 59 inches long and the center distance between the rolls is 30 inches. As on the other tables, the gears have machine cut teeth and run in oil. The speed of the rolls is 350 feet per minute. Each of these tables is driven by two 60 h.p. mill type motors connected in series.

A plate leveller is situated between the run out and hot bed tables, and this is a nine roll machine made by R. S. Newbold. The rolls are 10 inches diameter, 72 inches long and their speed is 158 feet per minute. Motor drive and screw down are of course provided. Extended shoe plates are provided to allow for removing leveller and inserting a dead roll when rolling slabs or billets.

A second continuous double skid furnace is installed alongside the first furnace, and is equipped with a hydraulic pusher. This will handle larger blooms and ingots up to 50 feet and the pusher will deliver material directly to the table. The capacity of both these furnaces is about 4,000 to 6,000 tons respectively.

It is the intention ultimately to make provision for four soaking pits, two to be installed later, but the first pits are four hole 6 feet by 9 feet with hydraulic operated covers. These pits are arranged for oil firing with provision for producer gas later. The soaking pit building is located immediately adjoining the furnace building, with the approach table through center, having two pits on each side.

The buildings in which these units are housed are of steel construction and provision is made for extending shipping room as required. The main building extends across the other buildings and is partitioned off from the power house.

PARTIAL VIEW OF TABLES AND MILL. NOTE—THE AUTOMATIC SWITCHES ARE IN THE GLASS-PROTECTED BUILDING TO THE LEFT OF THE TABLES.

The power house walls are reinforced concrete and glass with gypsum slab roof and concrete floor. The mill building and power house is served by a 40-ton crane, while other cranes in the plant are of 10-ton capacity.

With the exception of the mill and plate leveller, all the tables, shear pushers, punch roller, and accessory machinery was built in Canada. No doubt readers will remember our Jan. 8th issue in which we told of the work being done for this mill by the Dominion Steel Products Co., Brantford, Canada. The steel castings for the work performed in Canada were supplied by the Dominion Foundries & Steel, Ltd., from their own foundry.

The idea of producing as much as possible in Canada is to be commended, and here is how the work was distributed. The tables, including shear depressing and furnace pushers was made by the Dominion Steel Products, Brantford, Ontario, the shears by Canadian Allis-Chalmers, Toronto; manipulators by John Inglis, Toronto; buildings by Hamilton Bridge Works, Hamilton, Ont.; while the electrical equipment was supplied by the Canadian Westinghouse Co., Hamilton, and the Canadian General Electric Co., Peterboro, Ont.

A good feature of this installation is the railroad facilities provided. Three railway tracks serve the billet yard, shipping department and mill building, while a track runs right into the building at one point.

Briefly stated, the addition of this mill should mean much to Canadian business generally. Billets and blooms from 3 inches by 3 inches to 8 inches by 8 inches, slabs from 2 inches to 8 inches thick and from 6 inches to 40 inches wide are now available, while skelp of all sizes and weights 8 inches and wider can be made. Sheet bar (for sheets) of all sizes and weights can be produced, and universal plate from 7 inches to 41 inches of any thickness and length can be made. In addition to this list, sheared plate 66 inches wide, and of any thickness can be procured. The capacity of the mill being 150,000 tons per year will allow them to handle the demand easily. In fact, when in full swing this installation will be one of the largest steel finishing units in Canada.

# Increasing Production by means of Turret Lathe

## Possibilities of Such Machines Are Not Realized—Proper Planning of Operation Steps—Machining a Gear, a Clutch, and a Series of Collars—Making Tool Estimate Sheets, Also Time Study Sheets

By E. H. TURNER, Production Engineer for the Canadian Fairbanks-Morse Co., Ltd.

MANY shop men, and even executives are firmly of the opinion that it never pays to use a turret lathe unless you have a large quantity of similar shaped pieces to machine. This is an erroneous impression and the examples in the present article show clearly that in many cases a turret lathe can be used to advantage even on smaller quantities.

There are two reasons why manufacturers in general are not getting the production from turret lathes that they should. First they do not fully realize the possibilities of such lathes nor are they sufficiently familiar with the tools used. The second reason, is, to my mind, a question of the operator. The antipathy often shown by shop men to operate such machines to full capacity has caused many a one to exclaim, "Oh, you cannot increase production on that style of tool." This feeling can, I believe, be wiped out by offering additional wages for increased production, pointing out clearly to the workman that his increase depends on his efforts.

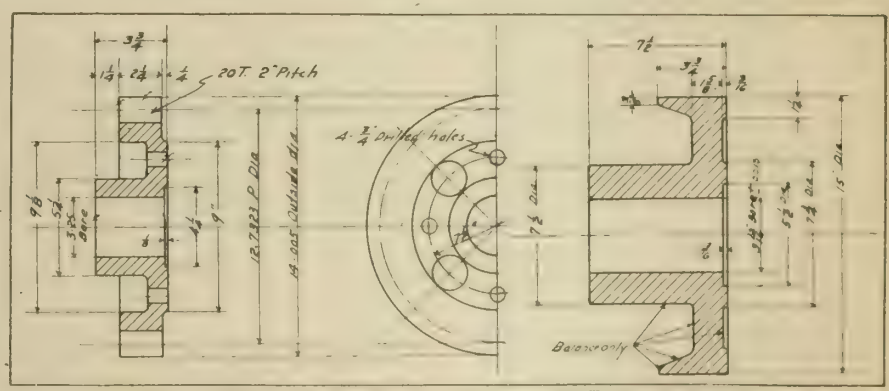


FIG. 1.—LEFT HAND VIEW. FIG. 6.—RIGHT HAND VIEW.

Proper planning of the operation steps is equally important. At all times make the tooling as simple yet efficient as possible. This will enable the operator to complete the work in the best possible time. To accomplish this requires a working knowledge of tool equipment, and such can be obtained in various ways; reading articles on the subject; by obtaining the information direct from the makers, or by practical experience in the shop.

In using pieces A, B and C for examples of work performed, it is intended to draw attention to the following points. First, these parts are taken from the

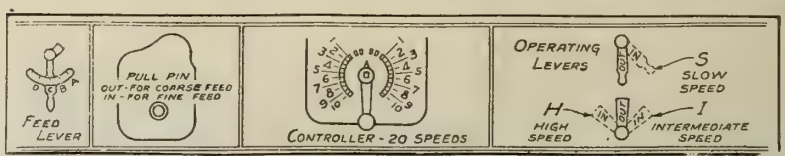
FIG. 4.—AN EXAMPLE OF A TOOL ESTIMATE SHEET.

work of one plant, the machine shop of which is producing very creditable work, both large and small. It might be well to add that all the examples embodied in the article are taken from Canadian plants, and the first three, already referred to, were being made on engine lathes when I first saw them, although the equipment in this plant included a 21-inch turret lathe in good shape.

The second point I wish to emphasize is that similar parts, even if not identical with those shown, are common in many plants throughout Canada. It was for this reason that I picked on these simple examples, believing they would be of greater interest than if I were to show more complicated pieces.

The third point I wish to refer to is this. The tool set up for example A is quite sufficient for machining all the pieces shown, also other similar shaped parts, which of course we have not the time to deal with. All that is necessary is merely a change of boring bar cutters, flat cutters, and tool post tools. The above points will no doubt convince the skeptical that engine lathe work can often be profitably performed on the turret lathe, and that it is not always necessary to have large quantities of one piece to make the change a success.

At Fig. 1 is shown piece A in detail, while at Figs. 2 and 3 we have layout drawings of the first and second operations respectively. The piece as illustrated is a cast steel gear to be machined as shown by the finish marks. Much might be written at this point about the information left off shop drawings, such as type of finish desired, limits allowed, etc., but as this is a turret lathe article let us stick to the main subject. In this case all dimensions given in decimals are to be held within a plus of .005 inch, while the other dimensions are near enough to within 1-64 inch. Originally, these parts were put through the shop in lots of 5 or 6, but it was found easy to arrange for lots of 15 to 20. The layout shown was made for lots of 10.



Let us refer to Fig. 2. The first essential in production is holding the work securely. Usually the largest diameter available should be held in the jaws. In this case the inside of the rim of gear affords ample holding surface and driving leverage for all cuts. The work is pressed against the chuck jacks and gripped on the inside of rim as shown on sketch.

Before placing work in position, the chuck bushing must be inserted. This consists of a cast iron outer bushing made an easy driving fit into the chuck plate. Inside of this outer bush is placed a hardened steel bushing having a hole to suitable size for the pilot on the boring bar. This hardened bush revolves in oil and is kept in place by a projection on the rear of the cast iron bushing, and a steel plate on the front end, this plate being held by three small screws. When the bar is in working position the hardened bushing remains stationary with the bar.

Next let us consider the tool post. Here is shown a right and left hand tool holder with the tools 4 and 3 in position. The order of operation No. 1 had best be told in steps. After chucking the work, using hard jaws, the faces of A and B are rough faced with the tool in tool post, side 3. Next the bore H is rough bored with bar at side 1 of the turret. After this the same hole is finish bored with the bar at side 4 of the turret. The fifth step is to start the tool on side 4 of tool post on face C of the work, following ¼ inch behind with the facing head at side 5 of the turret, this turning surface C, and facing surfaces B and A to semi-finished sizes. The last step in the first operation is to finish surfaces C, B and A with tools at side 2 of the turret.

It might be well to add that after face B is machined, the carriage stop was set so that the tool could be brought to the same position each time. The work is always measured from the chuck jaws out. This method of setting the stop likewise applies to the other positions where stops are necessary. It will be noticed that a reamer is shown at side 3 of the turret, but that no mention has been made of the same. The reamer is not used on this particular operation.

*The data contained in this article are taken from a Canadian plant, and are typical of almost any machine shop throughout the country. Tool planning is after all the big point to watch, for many a good machine tool is giving far from its possible service through poor tool layout.*

FIG. 5.—AN EXAMPLE OF A TIME STUDY SHEET.

With the exception of a dual holder that could be placed in side 6 of the turret, and a holder for the tool post, this equipment is what is termed a standard set of tools for Gisholt lathes, and the layouts I am describing throughout this article are for this style machine. The set up used on this piece is adopted for all other work shown, the only difference being the changes in cutters and tools.

When work of this nature is planned it is customary to make out a list of tools as shown at Fig. 4. With a list of this kind all tools necessary can be placed at the machine ready for making the set up.

A short talk on the art of setting facing cutters would not be amiss. The quickest method is to use a finished piece, placing it over the pilot bushing and setting all finishing cutters on side 2 of turret first (see Fig. 2), then setting the cutters on facing head at side 5 of turret, allowing of course the correct amount of stock.

It is common practice on work of this nature to prepare study sheets as shown at Fig. 5. In this case the study was made before starting to make the set up, and is based on a cutting speed of 50 feet per minute. Such a list can, however, be made up when the set is being made, or it can be changed from time to time to meet any adverse condition that may arise, or to take advantage of a favorable one. The time sheet shown is for a 21-inch motor driven lathe with D.C. connection. This drive, to my mind, is the most convenient, as the controller has ten speeds in either direction for each position of the levers S, H and I. However, the same plan is adopted if A.C. drive or belt is used. These sheets give complete instructions to the operator. For example in step No. 2 we see that the controller has to be set at position 5, and that under the speed column we have to set lever I, giving us a speed of 24 r.p.m. The next column refers to the pull out pin at end of lathe, this pin controlling the fine and coarse feeds, out position for coarse and in for fine feeds. The next column denotes a letter as used, also the feed to be adopted. The last item gives the actual time of the step in the operation. Allowances for moving tools from one position to the other are made at the end of the time

*The author of this article is well qualified to speak on the subject, as he is constantly travelling around Eastern Canada giving advice on turret lathe tool planning. He has told Canadian Machinery that this service is free and that any firm desiring information can have the same upon request. Such correspondence should be addressed to him, care of Canadian Machinery Editorial Department.*

study, then all items are totalled, this giving the actual floor to floor time. In the case shown, the first operation takes 22.25 minutes, the second 8 minutes, therefore the complete time for the piece is approximately 30¼ minutes. As a general rule a separate set-up sheet is made for each operation, but for convenience we have shown both studies on the one sheet.

### Second Operation

Referring to Fig. 3, it will be seen that the only equipment necessary on the second operation is two tools in the tool post at positions 1 and 3. These tools could have been placed during the first operation if so desired as they do not in any way interfere with the others. The equipment on the turret can be left intact. Merely draw the turret out of the way and proceed as follows.

The work is held in the standard jaws, and the faces D and E are completed with the two tools at sides 1 and 3 of the tool post. To machine two of these gears in the regular way requires 3½ hours, but the ten pieces are machined by the turret method described in eight hours, or a time per piece of 48 minutes including all set-up time. This is by no means a record, but when you figure that in many cases two to four hours are often used up in machining even one of such pieces, it leads to the belief that record breaking is not essential if we can make an improvement in production time such as we have shown.

### The Second Example

The next example B illustrates a standard cast iron coupling that has to be machined all over. Machining for balance is marked clearly and such parts require only one cut. Other dimensions have to be held to plus .10 inch, except the bore which has limits as shown on the drawing at Fig. 6. Two operations are necessary to complete this piece and following is the sequence of steps.

Referring to Fig. 7 we see the tool layout for the first operation. The work is chucked in standard hard jaws, and the face E is faced to carriage stops by the tool in side 4 of tool post. The bore A is also started by the tool at side 1 of the turret, this being held to a turret stop. Next the surface K is turned by the tool in side 3 of the tool post. The face H is now machined by the tool in side 3 of tool post, also the face F. The surface G is next rough machined by tool in side 4 of the tool post. The surface G is now straightened by the tool in side 2 of tool post. It might be well to add that in withdrawing the boring bar the rapid traverse is used as soon as the turret trips.

As we have already gone into the system of making out a time study sheet we need not dwell on this at great length except to say that following are the times on the different steps. Chucking 2 minutes, face E 1 minute 20 seconds, turn K 4 minutes, face H 2 minutes 40 seconds, face F 30 seconds, rough G 3 minutes, straighten G by hand 1 minute, operating tools 2 minutes. This makes a total operation time of 16 minutes 40 seconds. It will be noted that no time is given for rough boring the hole A as this was performed while the other tools were working.

### Operation No. 2

Fig. 8 depicts the tooling used in the second operation on piece B. In this case the work is held by hard jaws and the piece is supported by chuck jacks. The surface B is rough machined to stops, the tool of side 4 of tool post being used. The bore A is next finished with box at side 4 of turret. The same hole is now reamed by reamer at side 3 of turret. The surface C is roughed to stop and E is merely cleaned up. D is next roughed with tool at side 3 of tool post. This is followed ¼ inch behind by tool at side 2 of turret, and surfaces C, D and B are semi-finished. The last step con-

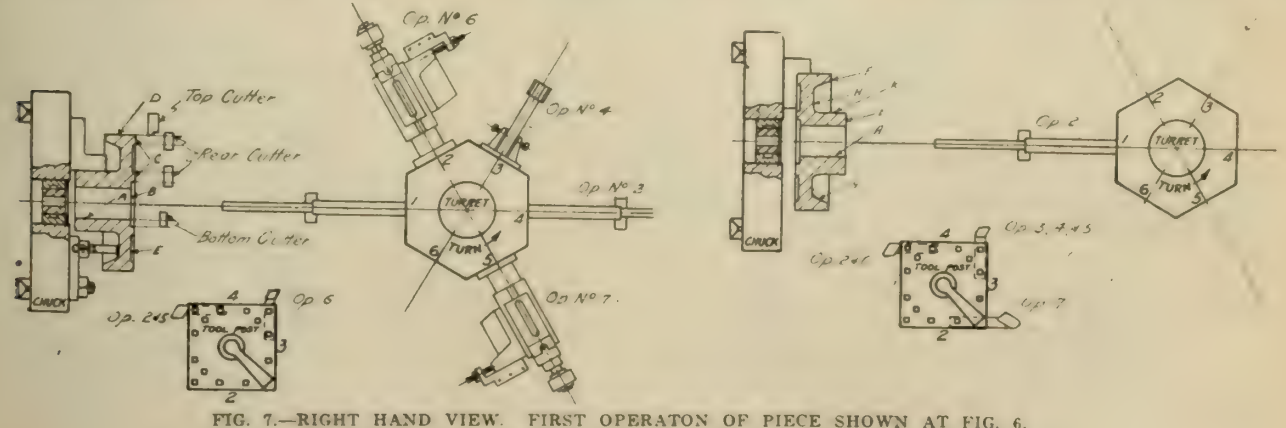

FIG. 7.—RIGHT HAND VIEW. FIRST OPERATON OF PIECE SHOWN AT FIG. 6.
FIG. 8.—LEFT HAND VIEW SHOWING SECOND OPERATION ON THE SAME PIECE.

sists of finishing the same surface mentioned with the facing tools at side 5 of the turret.

The time study for this operation follows. Chucking 2 minutes, rough B 25 seconds, finish bore A 1 minute 30 seconds, ream A 1 minute 30 seconds, rough C and clean E 3 minutes, rough D and semi-finish D, C and B 7 minutes 20 seconds, finish D, C and B 3 minutes 15 seconds. Total floor to floor time 20 minutes 40 seconds. This means that to complete the piece takes approximately 36 to 38 minutes, this including both operations. The best time on the former method employed was 2½ hours each, so that the saving is considerable.

### The Third Example

Example C at Fig. 9 illustrates a pair of standard cast iron saw collars. The face with a slight hollow near the bore must be true and square with the bore, and in this case the dimensions are not to close limits. Referring to Fig. 10 we see the tool layout sheet for this piece, and here is how the work is completed.

It will be noted that these collars are made from a casting long enough to make five or six pieces. To facilitate gripping the casting is made with a slight bevel as shown and is held in a pair of special jaws as shown. These jaws may be hard or soft as desired. The chuck bushing in this case is kept well to the front in order that the bar may be in as far as possible. Chips and dirt cannot injure such a bushing, if it is of standard design.

After chucking, the face B is machined by tool in side 4 of tool post. This, however, is for the first piece only. The hole A is bored and surface C is turned at side 1 of turret and side 4 of tool post. The bore A is now finished, and surface C by bar at side 4 of turret and tool at side 3 of tool post. The reamer at side 3 of turret now reams 3 inches into bore A. The face B is next faced to form by tool at side 2 of turret.

The piece is now parted at P by tool at side 2 of tool post. The eighth step is the reaming of other 3 inches into hole A by reamer at side 3 of turret. Face B is again formed and then the work is parted halfway down at P by tool at side 2 of tool post. E is next formed by tool at side 3 of tool post. The parting off is

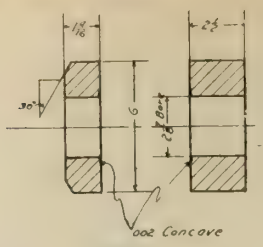

FIG. 9.

now completed by tool at side 2 of the tool post.

The time for the plain piece is about 9 minutes, while 11 minutes is approximately the time for the bevelled collar. There are a number of such collars of different sizes made at the plant I speak of, but the same equipment is easily adaptable to all. Many other examples of work even more complicated could be given, but sufficient has been said to emphasize the importance of studying the possibility of turret lathes.

To give readers an opportunity of making a layout for themselves, also a time study along the lines that the author has shown, we have prepared the examples D and E at Fig. 11. These pieces are at present produced on a 21-inch turret lathe, and it would be interesting to see comparative tool layout suggestions, showing these in a later issu with the present method employed. The preparation of such sheets would quicken the perception of the mechanic and Canadian Machinery will pay for all accepted material at regular space rates. Here would be the best method of submitting the material. Read the article carefully, cover the same points embodied in this work, make your layout sheets, give all possible data, then send it in to our office. After we have received a sufficient number of suggestions, we will publish the best of these, together with the present method of production.

## ERRATA

In our January 27th issue we published an article on the machining of monel metal castings. In this article we omitted giving credit to American Machinist, who were the first to publish the material. This was an oversight on our part; in fact, a footnote was prepared but was left out by mistake.

## ZINC SMELTING

Speaking on the spelter situation, Mr. H. M. Ridge in the "Journal of the Society of Chemical Industry" remarks that until conditions improve, the Old Country is dependent upon America for its supply. He points out that it will be some little time before either the British or Belgian works will be able to produce at full capacity. He states that no steps have yet been taken to make the country self-supporting, even although there are ample supplies to be had within the empire. He compares the various countries and remarks as follows:

"In the treatment of zinc concentrates no radically new methods have yet proved suitable. Electrolytic precipitation has been tried in a number of works in the country, but all of these have been shut down, including the Hoepfner process plant at Winnington, from which such a good product was obtained for several years. It is interesting to note that at the same time electrolysis has been adopted for the new plants in Tasmania, Canada, and at one place in the United States, but in each of these cheap power is available. The demand for high-grade zinc will be large in future, but it can now be obtained cheaply by new means which were worked out during the war. Much progress has been made with the electric-furnace reduction in Norway, Sweden, and France, and the troubles experienced in the condensation of the zinc vapor have been largely overcome, but here also cheap power is essential.

Charging the pots in the furnace probably used to be the most laborious work of the zinc smelter, and this has been overcome with the aid of charging machines. These are driven electrically, and are much more efficient than hand-charging, the pots being more uniformly charged and the charge denser. The duration of the manoeuvre is shortened by about two hours.

The more extensive use of machinery reduces the number of men, and at the same time makes the management more independent of the skilled workmen.

Before the war, 84½ per cent. of the total imports of South America came from European countries.

# *Operation of Railroads Under War Conditions*

## Actual Experiences—Locomotives Used—Necessary Repairs Often Unobtainable—How Absence of Power Brakes on Cars Was Overcome

*By Capt. A. H. Kendall, M.C., O.C.
Master Mechanic C.P.R., Montreal

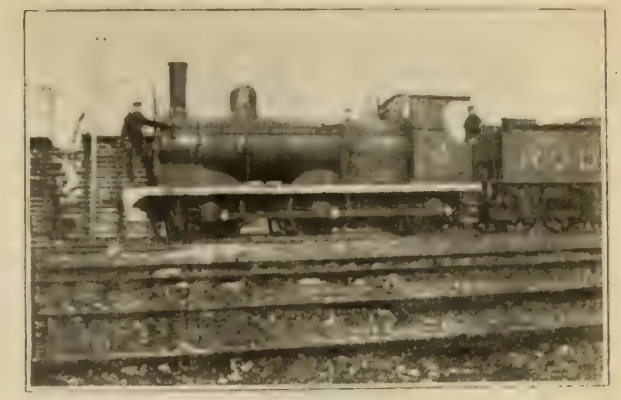

FIG. 2.—TYPE OF LOCOMOTIVE FIRST SUPPLIED

THE chief object of this article is to describe the actual experiences of a railway operating division under the severe and constantly changing conditions incidental to war manoeuvring. The original staff of the Canadian railway unit, for example, consisted of 3 officers and 266 men, and at the signing of the armistice this had increased to 17 officers and 1,567 other ranks, in addition to a large number of Chinese coolies and German prisoners, for the handling of coal, ashes, etc. Let me relate some of the engineering features in connection with the work of this unit.

"On arrival at Merris we found a railway yard of sixteen sidings, eight on each side of the main line, and a wye off the south yard. Off the south leg of the wye were three parallel sidings, two of them were 14 ft. centres and the third 20 ft. These three sidings were used as a locomotive depot, or locomotive despatch station. There were no shelters or other facilities available. Alongside these tracks was an irrigation ditch, with about two feet of water, full of vegetable matter, from which our water supply was obtained by means of Merryweather pumps. Merris was developed into a headquarters exchange and locomotive depot. Sub-depots were later established at Bailleul, Steenwerck, and Berguette. The latter station had previously been used by the Nord Railway as a divisional point, and it was, therefore, only necessary for the British army to improve the water and track facilities to meet their requirements.

"In developing the locomotive depot at Merris two 150 ft. concrete pits were put in at the end of the two sidings mentioned above. The sidings were extended, and over the pits we erected a sheet iron shelter, so that when necessary to make repairs at night lights could be used without being observed by hostile aircraft. Another shelter made of the same material was erected close by for use as a machine shop. A 50 kw. electric generator was obtained and used for supplying light for the depot; switches were placed so that all the exposed lights could be turned out during night raids.

"A washout pit was constructed. Engines were washed out every ten days and for this purpose a Merryweather pump, as shown in Fig. 1, was used. It may be said here that this little pump was one of the best friends of the railway men in France, for at times we were put to great inconvenience on account of failures to water supply. These pumps were made in two sizes of 5,000 and 10,000 gallons capacity per hour. In addition to the pumps in constant use we had several others in stock for use on the line in cases of emergency. Water tanks were erected, and kept filled by these pumps until such time as more permanent arrangements could be made. At Merris we later obtained a plentiful supply of very dirty water from the canal at Hazebrouck, five miles away. Oil burning pumps were installed at the canal and the water was forced through a ten-inch pipe line, which also had to be installed. At Merris a hole was dug in the ground and lined with canvas well tarred to hold a supply of 150,000 gallons, for use in case of emergency. This reservoir was filled to overflow from the tanks.

### Locomotives Used

"The locomotives supplied for work in this area varied in type, and the accompanying illustrations show the general dimensions of four of them. The 0-6-0 Midland railway engine, figures 2 and 3, was the type supplied when we first started operations. Of the fifteen engines of this type assigned to us several railways were presented—but the general design was similar. All these engines had slab frames and were inside connected. They had white metal bearings throughout and a spring boiler was used in the tender boxes and dope

*An abstract of a paper presented before the Canadian Railway Club in Montreal. The author was with the 58th Broad Gauge Operating Co., of the C. E. F.

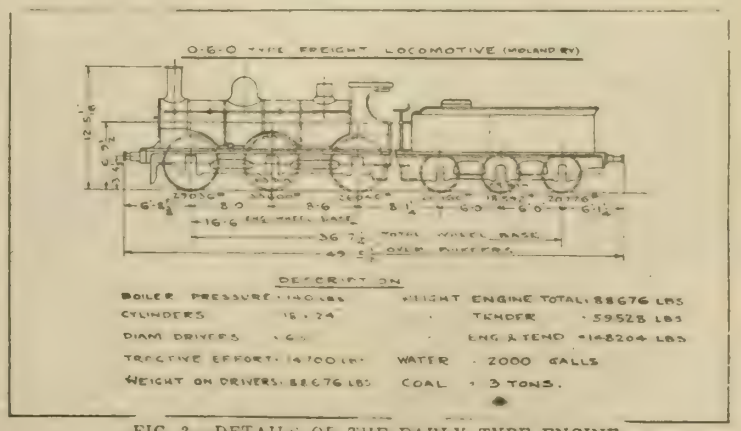

FIG. 3.—DETAILS OF THE EARLY TYPE ENGINE.

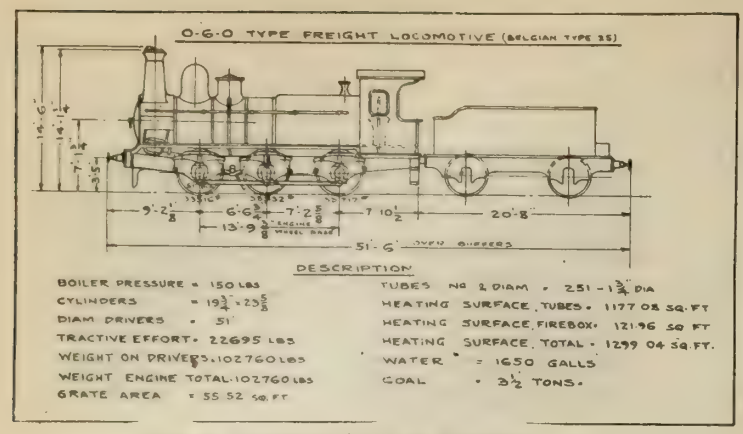

FIG. 4.—BELGIAN TYPE 25 ENGINE.

FIG. 5.—THE BALDWIN TYPE USED LATER

in the main boxes. Wool waste could not at times be procured and as a substitute we used hemp rope, stripped, bound in stacks, and stood on end. This was only a fair substitute, but it met requirements. The tubes and fire box sheets were mostly made of copper and when the boiler was kept clean they gave very little trouble. The chief maintenance repairs were driving boxes, side-rods and springs. Prepared white metal was kept in stock ready to be melted for all bearings. At times it was most difficult to obtain the necessary repair parts and we occasionally had to run engines with one or more springs missing, with the engine blocked up on hard wood. The springs on this type of engine were separately hung and readily adjusted by tightening or loosening the nuts on each hanger.

"The brake equipment was either steam or vacuum. We had, however, several Belgian engines, as illustrated in figure 4, with no braking power whatever on the engine and only hand brakes on the tender, the shoes of the latter being made of wood. Another Belgian engine in service was equipped with Westinghouse air brakes and this was used for personnel and ambulance trains. The 2-8-0 Baldwins, shown in figures 5 and 6, and Canadian built engines superseded the above mentioned classes of engines for handling through traffic. The 2-6-2 Baldwin engines, illustrated in figures 7 and 8, were used for short runs, and as they were delivered new the maintenance was not heavy. The engines were never killed except for boiler or grate repairs, but were kept constantly under steam for use on short notice. Where possible engines were double crewed, but when traffic was very heavy and men were scarce, all were pooled.

"As previously stated, Merris exchange yard consisted of sixteen sidings, which were 1,400 feet long. The chief control, or despatching station, was located here, and telephone communication established with all stations, the Nord Railway and the army signal systems. When a train left the despatching station, Boulogne for instance, Merris exchange was advised of the number, the consist, and the leaving time. Passing reports were also received from the reporting station on Nord lines. On arrival of the train at Merris the despatching station engine was taken off, sent to the locomotive depot, and made ready for the return trip. The crew was given eight hours rest, and when possible, a hot meal and 24 hours' rations before making the return trip. In the meantime the train was marshalled in the yard according to requirements.

"To overcome the absence of power brakes on cars, trains had to be made up with a brake van on each end, and with sufficient cars with hand brakes properly spaced throughout the train to provide the necessary braking power. A small white light was placed below the buffer beam on the front of the engine, and one red light on the rear of the train. The train crew consisted of a conductor and one or more brakemen, the former in the front van and the latter at the rear or on the braking cars. The engineer, not the conductor, was primarily responsible for the train.

"On Nord lines, trains were handled on the automatic system, and on the railroad operating divisions on the station block system. The latter were divided into sections, and at each station, hand, or at night, when possible, lamp signals were given to engineers in accordance with the prescribed rules. No engineer was permitted to proceed into a section until he was furnished with a train order, printed in French and English, indicating that the section was clear or occupied. In event of the section being occupied it was necessary for the engineer to proceed to "Caution" after signing the train order. The engineer's copy of the train order was handed by him or his fireman to the station master or blockman at the end of the section to which it referred. It was permissible to run all trains at "Caution," with the exception of ambulance trains, which were always handled on the absolute station block.

"When possible, trains were run at regularly spaced intervals throughout the 24 hours, but for obvious reasons traffic had to be suspended for a time, and then the trains unavoidably fleeted. Although traffic for the front was of the first importance, the shortage of equipment made it necessary to avoid delay to return empties as much as possible. Weekly census was taken of the waggons, and the compiled report was forwarded to the "Commission de Reseau du Chemin de Fer du Nord" at Paris, and a summary wired to R. O. D. headquarters.

"Traffic was usually heavier at night, particularly forward of exchange stations, and on account of shell holes, and other track breaks caused by bombs, the movement was somewhat slower than in the daytime. When these breaks in the track occurred telephone lines were usually torn down by the force of the explosion and communications cut with the stations beyond. The tracks were patrolled by track walkers, and gasoline track motors were used ahead of trains, when available. Notwithstanding all the precautions taken, however, an odd train on the block of an-

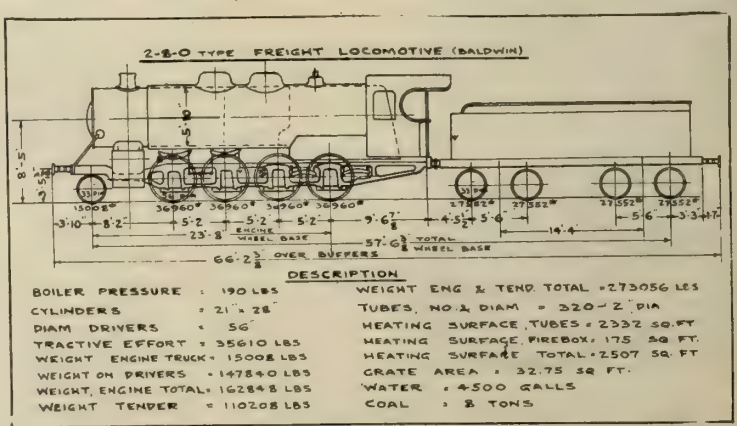

FIG. 6.—DETAILS OF THE BALDWIN FREIGHT LOCOMOTIVE.

FIG. 7.—THE TYPE OF ENGINE USED FOR SHORT RUNS.

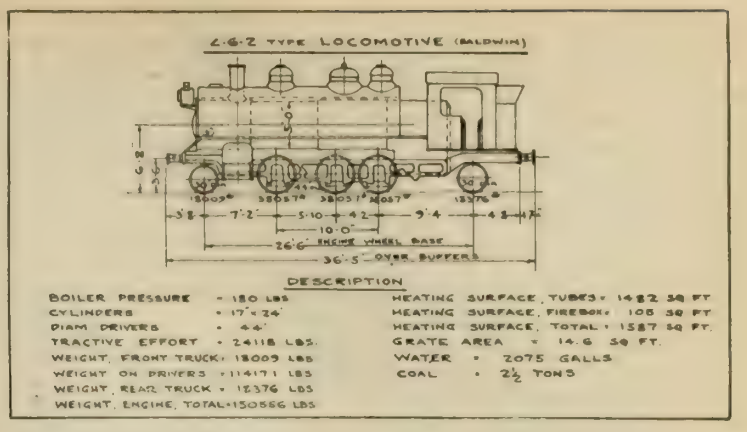

FIG. 8.—DETAILS OF SHORT RUN LOCOMOTIVE

ther train, which had passed safely, ould run into a shell hole without anyne being warned that the shell had nded. Engineers were sometimes required to take a train over new and unamiliar lines in the forward areas, vithout a pilot, and on which they would liscover heavy grades and sharp urves. On descending the locomotive would whistle for brakes and trust to luck to find their train still on the rails it the bottom. Some of the forward area grades were 2.5 per cent., and unless the trains were marshalled with sufficient brake vans the result was obvious. The absence of lights on switch stands at stations, etc., made operations all the more difficult. It was often necessary to divert traffic from one line to another on account of the tracks being badly blown up in places.

"In the extreme forward areas it was necessary to cover the cab with a large tarpaulin in order to baffle the light caused by opening the firebox door. In this service below Messines Ridge we had two engines equipped so that the exhaust could be turned back into the tender, so that during periods of inactivity on the front we were able to get trains of ammunition up closer with a minimum noise.

"Locomotives were also used to stand by railway mounted guns, and in this area we had as many as eight, ranging from 9.2 in. to 14 in. When the large guns went into action locomotives were used to spot them after each shot was fired, also to move the guns to alternative positions in the event of their location being discovered by the return fire of the enemy."

"When the advance on the Somme got under way we were advised by headquarters to get ready to move. We then went to the fourth army area and established headquarters at Chemin Vert; a British railway exchange yard just off the Amiens-St. Quentin-Nord main line at Weincourt. The advance in this area was, of course, very rapid, and upwards of 15,000 railway construction troops were used in this area to get the railways back into serviceable condition. Every rail had been put out of commission, bridges blown up, timber burned, deep fills mined and blown up, water systems destroyed, etc. Trains of supplies and ammunition were moved up the same day the rails were laid, even before the track had been lined or surfaced. It will therefore be understood that there were some derailments, but there were plenty of men and material available to do the rerailing. If the equipment was off the track very badly and we did not have time to handle it, the equipment was moved clear of the track and traffic handled as usual until we could get the wrecking cranes into service without causing much delay to traffic.

"Until the Somme River was reached great difficulty was experienced at Chemin Vert on account of the lack of water. We procured two tank trains and had to send them to Amiens daily to be filled with water. Deep wells were sunk, but the chalky formation of the soil, even when water was discovered, made it altogether unsuitable for use in locomotive boilers without first being given treatment. Pumps were later installed near Mericourt and a pipe line laid from the Somme River to Chemin Vert.

"On account of the rapid forward movement of the army it was necessary for us to send out additional detachments. The first one was sent to Omiecourt, near Chaulnes. The main local depot and exchange yard were built at Omiecourt, just off the Nord line. The line from Amiens to Chaulnes was left for operation by the Nord railway. The lines built by the railway troops in this area and taken over for operation by us, extended from Chaulnes through Peronne to St. Quentin, together with all British army lines in this area east of the line mentioned. Omiecourt, plan of which is shown in figure 9, was developed as the main locomotive and exchange depot in this area. The facilities at Omiecourt consisted of an incoming and an outgoing yard with ten 1,800 ft. sidings in one and 12 in the other, a coal ramp with a capacity of 1,000 tons, a concrete reserve water reservoir with a capacity of 25,000 gallons, and two ele-

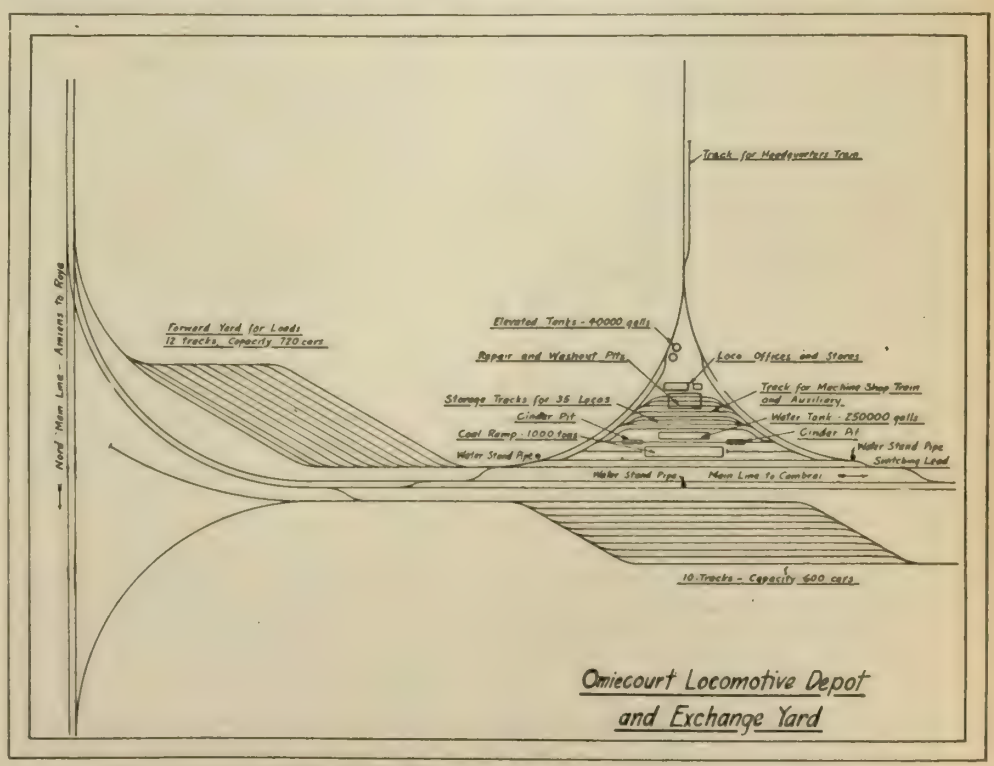

FIG. 9.—PLAN SHOWING THE DEPOT AND EXCHANGE YARD AT OMIECOURT

vated 20,000 gal. tanks; these latter tanks being filled by raising water from five deep wells. The locomotive depot was constructed so that 100 locomotives could be taken care of. The machine shop equipment was fitted up in large French steel brake vans and was readily transferred from one depot to another when required. The power was obtained from an electric generator run by gasoline engine. We also had a 35-ton steam crane, which was the largest one in use. The heaviest traffic was handled through this yard during the week ending October 3rd, 1919, this being made up of the following cars: troops and remounts, 2,490; supplies, ordnance, ammunition, and general traffic, 9,921; construction material, 884; ambulance 1,605; a total of 14,900 loaded cars.

"One of the drawbacks to the prompt handling of traffic in this area was the explosion of numerous delay action mines placed in embankments by the enemy when retreating. Although they had destroyed the steel and ties they had also mined nearly every fill of any size, as well as many junction points, diamond crossing locations and bridges. Even when bridges were blown by them other delay action mines were left to blow the new bridges, which they knew would inevitably be constructed. There were various types of mines, but they all had the acid timing arrangement. One of the biggest mines blew up the double main line near Marchelpot as late as January, 1919. Taking into consideration, however, the large number of mines placed, the unit was fortunate in only having had three locomotives wrecked through delay action mine explosions. At the signing of the armistice the unit had 101 locomotives in service. On the first of January following demobilization was started and this was completely carried out and the lines turned over to the Nord railway, and the Canadian railway unit entrained for the base on April 8th, 1919."

In the discussion that followed the reading of this paper some very interesting points were brought to light. Speaking on the class of men recruited for the R. O. D., Mr. Kendall said:—"We found that the men would have to apply themselves to all kinds of work, such as cooking, mending shoes, and various other incidental duties. For instance, we found that we had a road foreman of engines as chief cook. A chief clerk to a general superintendent was a call boy, but it was soon realized that the men who took up in the proper spirit the duties that were assigned to them at the start were the best men. We never had any complaints."

To illustrate the improved conditions resulting from the transportation problems being taken over by the R. O. D. we give the remarks of W. N. Dietrich, late C.S.M., 58th B.G., O.C.: "The most important section of the railway in the north of France for the use of the Allies was that connecting the sea ports of Calais and Boulogne with the cities of Bailleul and Armentieres. Before Capt. Kendall's arrival it had taken two days, or 48 hours, to handle shipments over the section. When he took it over and got things in working condition the trains were operated on a seven and a half hour schedule, and this was later reduced to seven hours, and notwithstanding the traffic was very dense, the total detentions for a week only amounted to a few minutes."

## GRAPHITE AS A LUBRICANT

All criticisms of graphite can be traced directly to its impurities. The impurities in lubricating graphite my be divided into two classes: those that have a positive abrasive effect and those that act neither as abrasives nor lubricants. Artificial graphite may be made very high in carbon, but since it is a by-product of the electric furnace process of making silicon carbide, it is likely to contain traces of this, which is very objectionable, as silicon carbide is one of the most abrasive substances known. In the natural graphites the objectionable impurity most commonly found is silica, or common sand. So says Brass World, which continues as follows:

The harmfulness of the impurities depends also on the size of the particles. If the size of the abrasive particles in a graphite is greater than the average thickness of oil film, their abrasive effect will be greatest in a bearing running under uniform pressure. On the other hand, in a reciprocating bearing under high duty, where the oil film is alternately broken and restored, all the different sizes or particles of the abrasive material may come into play, and it is in the latter class of bearing that pure graphite is most essential and that abrasive impurities are most harmful.

Among the many impurities in the natural graphite we find some that are not, by nature, abrasive, but are undesirable and injurious to bearings. To illustrate, let us take the particle of a so-called flake graphite, where we have alternating layers of mica and graphite held together in a manner capable of sustaining considerable compression. Let us imagine stoking an engine at night with a layer of these laminated particles between a heavy crankshaft and a babbitt or lead bronze bearing; the inevitable result will be "pockmarking" of the bearing surfaces. The effect on a reciprocating bearing would be equally undesirable; and it will be readily seen that the jamming effect produced in a ball bearing by the use of this graphite would be ruinous.

For lubrication, the graphite should be such as to permit an infinite divisibility while in contact with bearing surfaces. It should be uniformly fine enough to practically maintain suspension in the oil or grease, so as to permit of the application of the lubricant without undue difficulty due to settling, and it should be fine enough to enter properly betwee the bearing surfaces without clogging this will allow it to flow freely in the o film between the bearing surfaces. Fo all ordinary lubrication with the lighte grades of machinery oil, none of th graphite particles should be coarser tha 0.0003 inch; grades of graphite used wit greases or heavy oils would be satisfac tory if ground considerably coarser, ow ing to the correspondingly thicker oi film which exists with these lubricants.

## SMALL ELECTRIC FURNACE

A convenient laboratory electric furnace for temperatures up to 2,300 degrees Centigrade is described in a recent issue of "Chemical and Metallurgical Engineering." This furnace is of the granular coke-resistance type and uses 1-inch graphite electrodes, and 1¼-inch graphite crucible. The rods, supported by suitable sized pipe-fittings, pass through silocel brick, and continue to within 1½ inch of the crucible. Granulated coke is used to fill the space around the electrodes and crucible. The crucible is made by sawing off a length of graphite rod of desired diameter, and drilling out the centre in a lathe. The entire furnace is constructed of 9 in. by 4½ in. by 2½ in. silocel blocks, and is heated by an air-cooled, step-down 2.5kva. auto transformer. The primary is wound for 220 volts, having eight different taps for connections which give a voltage range of from 20.7 to 38 volts on the secondary.

This arrangement does not require the use of any outside resistance, as the current and temperature are controlled by means of the various contacts on the primary winding, and also by varying the pressure of the electrodes on the granulated coke between the electrodes and the crucible. The transformer is connected to the furnace electrodes with stranded copper cable. The corresponding amperes for the eight steps on the primary winding range from 65 to 120 amperes, or from 78 to 144 amperes, with 20 per cent. overload, which may be drawn for short intervals (20 to 30 minutes) without hurting the transformer. Temperatures as high as 2,200 degree to 2,300 degrees Centigrade have been obtained from the above, from a cold start, in 20 minutes.

## ERRATA

In the February 24th issue, page 35, we made the following statement: "A great advantage of ball bearings is the saving of power. The University of Wisconsin made a test some time ago which illustrated that **Roller Bearings** required the least amount of power."

It is self-evident that this was a typographical error, as what was intended was **Ball Bearings**, not roller bearings. We make this announcement so that readers will not get confused and will be able to follow intelligently the second portion of the article on ball bearings which will appear March 17.

# A New Method of Case-Hardening Steel

## Recent Development in the Carburizing of Steel—Greater Speed, Uniformity, and Depth Are Claimed—Factors Governing Case Hardening and Present Methods in Use

*By W. J. Merten, Metallurgical Engineer, Westinghouse Electric and Manufacturing Co.

IRON and low carbon steels absorb carbon from so-called carburizers very readily when in contact with these carbonaceous materials at temperatures above the upper critical point ($Ac_1$). The quantity of carbon absorbed depends upon:

1. The temperature or degree of heat above the $Ac_3$ point of the steel; or, in other words, the higher the temperature the faster and deeper the penetration of the carbon. This temperature is high enough to change the iron to gamma iron, which is capable of forming a solid solution with carbon or cementite. Beta and alpha iron do not absorb carbon to an appreciable extent.

2. The character of the carburizer is a very important factor in the successful conductance of case-hardening. Elementary carbon as such is only of secondary importance. Oxygen and nitrogen compounds, which are added or are naturally present in the so-called energizers that form carbonaceous compounds with solid carbon, are necessary to generate nascent gaseous carburizing mixtures of carbon monoxide and cyanogen gas (CO and CN). Flourishing industries are built up on the production of these carburizing materials and energizers.

3. The percentage of carbon present in the steel to be case-hardened has also a marked influence upon the affinity of the the material for more carbon up to saturation. More specifically, a low carbon steel absorbs faster than high carbon steel.

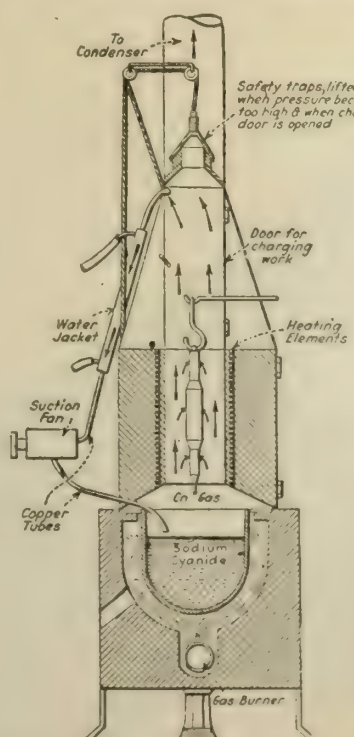
4. The presence of chromium, tungsten, or manganese accelerates the absorption of carbon since these elements form double carbides with iron. Nickel and silicon, however, retard the absorption. The fact that they form solid solutions with iron may be the cause for this retardation.

From the statement under paragraph (2), which states the necessity of nascent carbonaceous gas formation for penetration and absorption of carbon, it is readily conceivable that, if a properly heated piece of steel be brought into contact with pure nascent gas continuously generated in a separate unit or chamber and preferably under pressure, the conditions for case penetration would approach the ideal.* A process of this type is the one presented in this paper; but before giving the description a survey of the processes now in vogue with their disadvantages and deficiencies seems to be appropriate.

*Presented before the Pittsburgh Chapter, Heat-Treaters Research Society, Sept. 9, 1920.

### Present-Day Methods of Case-Hardening

First Method. The most general and commonly used method of case-hardening is conducted by packing steel parts in a metal box filled with carburizing materials, and then firing the tightly closed box and contents at a sufficient high temperature for a length of time adequate to give the desired depth of case. This process is quite simple and assures fair success if properly conducted in accordance with a prescribed procedure, experimentally determined to give certain definite results under definite and specific conditions. The disadvantages of the process are:



1. Uncertainty of obtaining the proper reaction within the closed box.

2. Difficulty in duplication of results as pre-determined, because of non-uniformity of carburizers.

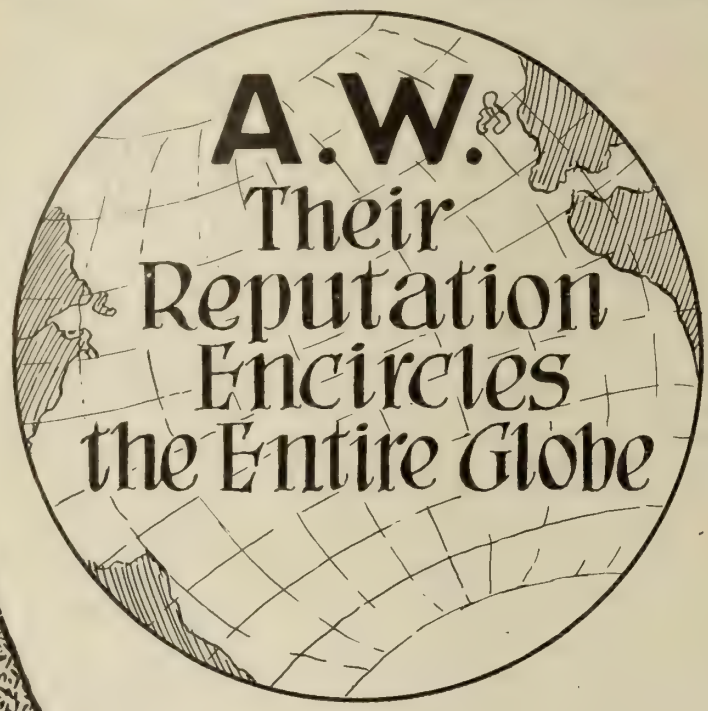
3. Long time exposure of the steel to a heat not well controllable produces a questionable structural condition.

4. High cost of operation because of the inefficiency of the heating method, the cost of the boxes and the rapid deterioration of them by oxidation or scaling.

Second method. Another method of case-hardening is performed by immersing the steel article in a cyanide bath heated to about 860 deg. C. (1,580 deg. F.). This process is convenient and effective on small articles only and where the depth of the case required is not more than 0.005 in. to 0.015 in., or where mere surface hardening is wanted. This is a fast case-forming method, and from 10 to 15 minutes gives the desired depth. The outstanding disadvantage of this process is that no uniform case can be produced. The parts deep in the melted bath do not get the same penetration as the parts near the surface. The evolution of the cyanide gases at or near the surface favors the penetration, and it is hardly feasible to have pots with a large enough surface area to take care of the case-hardening work of an entire plant.

DETAIL OF REGENERATIVE CYANOGEN GAS CARBURIZING FURNACE.

Third method. The third method consists of dipping of a cherry red piece of steel or tool into a container of a powdered cyanide salt, such as potassium cyanide, sodium cyanide or ferro and ferri cyanides; or sprinkling the powdered salt of these cyanides on the red hot steel furnace and putting the steel back into the fire again. The case-hardening produced in this way is but a very superficial one, and resistance to excessive wear cannot be expected.



Fourth method. In the fourth method the carburizing gases are passed over a piece of steel heated in a retort. This process is applicable to parts that are intricate in design.

All these processes serve the needs of the different industries more or less satisfactorily. Box case-hardening is at best dirty, wasteful and unsatisfactory in a number of instances. Case cyaniding by firing in fused cyanide salt is inefficient, unreliable, dangerous and costly. Retort case-hardening with carbonaceous gases is a step in the right direction, but it leaves something to be desired on account of the selection of the carbonaceous gases and the method of application.

### Cyanogen Gas as a Carburizer

The process to be discussed next, although still in the experimental stage, owing to radical changes in the principle employed, appears to present opportunities for efficiency, preservation of the product, simplicity of operation, assurance of uniformity and duplication of results, speed of operation, reasonable cost, and wide range of utility. We may call this process a regenerated cyanogen gas case-hardening.

It has long been recognized that the most effective carburizing gas is cyanogen (CN), that by it a case can be produced more rapidly, with greater uniformity, and with deeper penetration

than one produced by carbon monoxide (CO); but the highly poisonous character of the substance has been a serious objection to its use, and the tendency is to wastefully lead the gas to the stack and out of harm's way, instead of controlling it to get maximum efficiency.

To case-harden steel and iron alloy articles in a stream of cyanogen gas evolved from a container filled with an alkali cyanide salt, heated by electrical energy or other means to accomplish vaporization or boiling of the salt, is the principle upon which the new process is based. The articles or materials to be processed are independently heated out of contact with the fused cyanide salt. The advantage of this will readily be appreciated on recalling the statements made regarding the fact that case-hardening is produced by contact with gaseous and not with solid carbon, and more especially with cyanogen gas. The depth of penetration is then only a function of the uniformity of the temperature of the article treated and the duration of treatment. Nascent cyanogen gas has a speed of penetration of four or five times that of carbon monoxide.

The furnace shown in the sketch embodies the regenerative principle, since the excess gases not absorbed by the steel are forced under pressure into the fused cyanide bath, are reheated, causing a vigorous stirring of the bath and a lively evolution of cyanogen gas. The gas is thus produced with more energy and in larger quantities, and it more vigorously attacks the surface of the steel, thus causing an accelerated and deeper penetration.

### Regenerative Type of Furnace

This regenerative type of furnace is a means of using the rather expensive salt economically, as the nitrogen gas on returning to the bath will combine with the sodium, and a carbon supply in some cheap form such as charcoal can be added to the liquid as required, thereby retaining the original amount of cyanide salt intact. It is, therefore, obvious that this process may compete with the present box or packing carburizing processes.

To prevent the poisonous gases, which are under pressure, it should be recalled, from escaping into the room, the suction fan is shut down before the charging door is opened, a bell ventilating device for inducing draft is arranged so as to open the bell when the fan stops and prior to opening the door. The speed of the pump or blower is to be regulated so as to cause the desired degree of circulation. Parts of the pump or suction fan wherever possible should be of non-ferrous metals, such as copper basic alloys or hard copper. Water cooling jackets or other protective methods are to be employed for the return flues containing hot gases, and the nozzle end of the flue must be of hard copper, monel metal or other non-ferrous alloy with a high melting point.

Sodium cyanide melts at 600 deg. C. (1,112 deg. F.) and boils at 800 deg. C. (1,472 deg. F.). The temperature of the pot must therefore be not less than 800 deg. C., and to effectively absorb the gas the steel is at a temperature above $AC_3$, or about 900 deg. C. (1,650 deg. F.).

The furnace illustrated in the sketch is designed especially for the processing of shafts, but a slight modification of the upper or steel heating chamber will adapt it to a variety of work. Grates of nichrome metal with knife-edge grate bars for supporting the work can be employed.

The advantages of this process are the following:

1. Temperature control is more perfect, since a pyrometer is inserted directly in the heating chamber;

2. It gives a finer, more uniform, and deeper case than any other process and requires less time, and is therefore cheaper;

3. It eliminates the use and storage of carburizers and carburizing boxes.

The efficiency of cyanogen gas for case hardening has never been fully appreciated, nor has it been fully obtained, since during previous tests the temperature was at or below the boiling point of sodium cyanogen (1,465 deg. F.), which is considerably below the $AC_2$ point of the steel. But, even in this unfavorable condition an exceptionally high speed of penetration has been noted by different writers on the subject.

It should be noted that, while some of the less important features of this process are still speculative in character because of the experimental stage of the development, the method is based upon well known principles and the conclusions have been drawn from a careful study of general case-hardening practice.

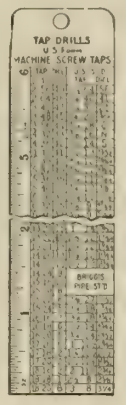
## SECURING PROPER LUBRICATION

Sluggish action of oil-rings leading to improper lubrication of motor bearings was cured by bevelling the sides of the rings of motors made in a large New Jersey factory after considerable searching for the reason for the trouble. On testing these motors, says Electrical World, it was noticed that the ring would creep along at a very slow speed, two or three revolutions a minute on a machine of several horse-power, instead of the regular speed of about thirty to fifty revolutions. Though all journals and rings were made in large numbers and as nearly alike as possible, this trouble appeared on only about one machine out of ten, and disappeared nearly every time a new ring of the same size and shape was put in. Sometimes, of course, it was due to the ring rubbing against some projection on the casting, but more often no apparent cause was found by the assembling department. At that time the oil-rings were cut from a rather heavy brass tube with straight sides, making the cross-section rectangular in shape, while the journals had a straight slot about twenty to twenty-five mils wider than the ring.

It was finally discovered that under certain conditions the ring would start with the machine and perhaps come up to normal speed, but soon work itself towards one side of the slot and slow down, hugging closer and closer until there was only a very thin film of oil between the ring and the flat part of the journal.

Therefore, in an attempt to prevent sticking, three rings were removed and their sides were slightly bevelled, when the trouble entirely disappeared. Since that time all oil-rings are bevelled either from the outside or from the inside, and there has been no sticking.

## PLAY SAFE



In climbing a ladder, do you ever pause to think "Am I safe"? Instead of pausing, partly up the ladder, why not investigate before you leave the ground? Watch the angle at which it rests. Seventy-five degrees has been found to give the greatest degree of safety, and to secure this angle all that is necessary is to place the foot of the ladder a distance approximating one-quarter of the length of the ladder away from the vertical. This angle will prevent undue straining of the ladder or slipping of the ladder feet when placed too flat and at the same time will give the feet of the workmen sufficient room when they are working near the top of the ladder. Another point that should not be forgotten is that portable ladders should be fitted with safety feet or points in order that a sure grip on the floor or ground may be secured.

## POWER FROM WASTE WOOD

The progress which has been made by British firms in the construction of suction gas plants for utilizing waste wood should be of special interest to this country, where there are still large quantities of wood available. These plants distil the wood and produce gas which is of excellent quality for use in gas engines. This method of utilization is said to be more economical for power producing purposes than burning under a boiler. A recent example of a large installation on these lines is afforded by a mine in a British Dominion, where four suction gas plants capable of yielding a total output of fourteen hundred horse-power have been installed. The fuel used is in the form of logs up to two feet long and a foot in diameter; and the gas is applied to the driving of four horizontal gas engines. Three of the engines drive electric generators and the fourth is coupled to an air compressor for operating pneumatic drills and hammers in the mine.

# Have You Tried This Contest Yet? If not--- Do so Now

Below will be found twelve references to advertisements in this number. To the sender of the first correct set of answers to these we will forward one of these scales.
To win one is not difficult, and at the same time you will add to your store of knowledge. Read the details given below.

The scale is 6 in. long and is made from finest quality steel. One side is marked in 32nds, the other side in 64ths. A table of decimal equivalents is also stamped on one side, and a table of tap drill sizes on the reverse side. This scale is well worth securing.

## What You Have to Do

We publish every week a number of interesting facts or statements selected from the advertising pages for that week. The selections for this issue are given below. Read these through, then turn to the advertising section and see if you can pick out the advertisements to which they refer. The work is interesting, it will train your powers of perception and of memory, it costs you nothing, it will make you better acquainted with the various lines of machinery and tools in the market, and with perseverance you are bound to win one of these useful scales as a prize.

Nine contestants solved the twelve questions in Feb. 10th issue correctly. This meant we had to use the elimination method once more. A visitor who was in our office was asked to pick on one of the papers, all of which were face downward. John McNaughton, Westville, N.S., was the lucky one, while the others who came so near the prize were: Mr. Baird, Windsor, Ont.; Albert Hepworth, Philadelphia; Geo. A. Todd Penetanguishene, Ont.; G. Overton, London, Ont.; W. Smith, New Liskeard, Ont.; W. S. Miners, Sarnia, Ont.; H. G. Zimmer, Waterloo, Ont.; and John A. Scarsbrook, Winnipeg, Man.

**CONTEST FOR MARCH 3RD ISSUE**

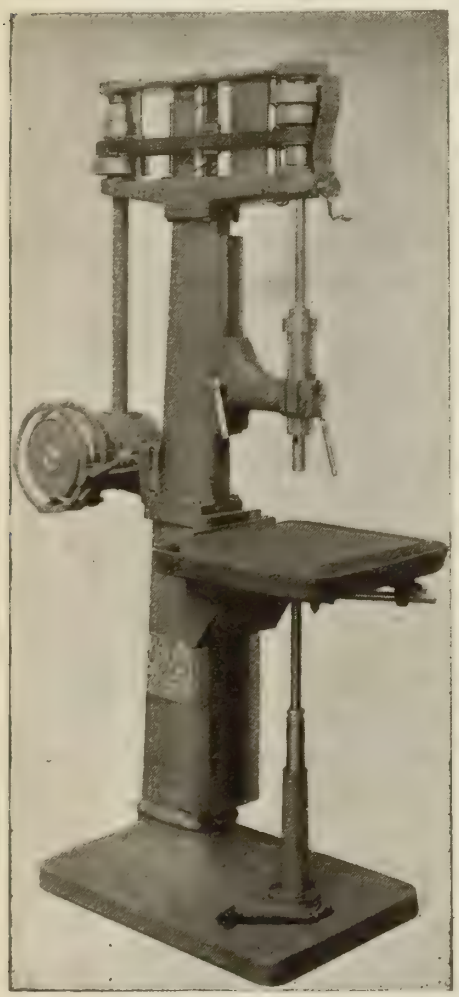
**Contestants are required to write us, stating to which advertisements we refer in this number.**

1—How to prevent weariness and discontent.
2—What one concern says you should consider if you want to increase production and quality.
3—Something that makes the engineer speak up.
4—Something that should be thrown away after a certain time.
5—How to get furnaces and fuel to suit your conditions.
6—Something that takes its power from an ordinary lamp socket.
7—How to handle work that requires heat, with a high degree of efficiency.
8—How to conserve oil.
9—How to secure volume production.
10—A good piece of advice in regard to money.
11—Something that costs little for upkeep.
12—Something worth considering and which will save you money.

**These are Correct Answers for List from February 10th Issue:**

1—L. S. Starrett Co.
2—The Carlyle Johnson Machine Co.
3—The Kearney & Trecker Co.
4—The J. G. Blount Co.
5—Thos. Firth & Sons, Ltd.
6—Murchey Machine & Tool Co.
7—Roelofson Machine & Tool Co., Ltd.
8—Cleveland Pneumatic Tool Co. of Canada, Ltd.
9—Geo. D. Roper Corporation.
10—The Bilton Machine Tool Co.
11—McKenzie Bros.
12—The Gisholt Machine Co.

## Closing Date for This Contest is March 24th.



# DEVELOPMENTS IN SHOP EQUIPMENT

## BALL BEARING DRILLS

The Providence Engineering Corporation, Providence, R.I., have placed on the market the line of ball bearing drill presses formerly known as the Mason drilling machines. They are now to be known as the Pecorp machine.

These machines are equipped with ball bearings throughout, and range from the small bench type up to the heavier style shown in the illustration. The spindle is self-oiling, is made from tough spindle steel, and has a reservoir in the sleeve that contains sufficient oil to lubricate the spindle for a week. Various other features are included, and the complete range of speeds is said to be obtainable in less than two seconds. Unit construction of parts is followed out throughout the construction of the machine.

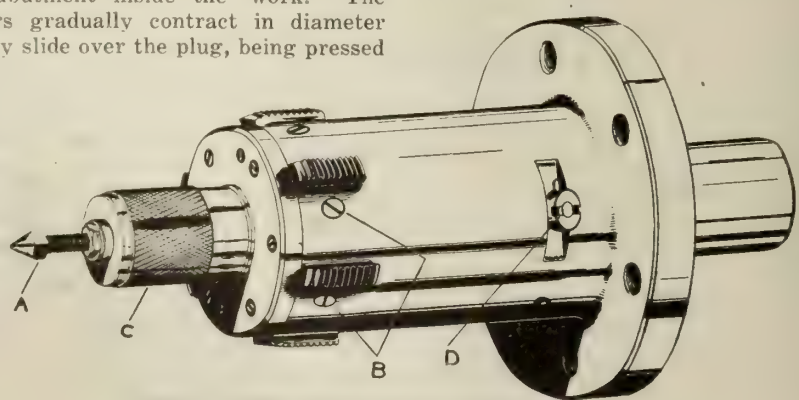
GENERAL VIEW OF BALL BEARING DRILL PRESS.

Various arrangements can be made on these machines. They can be made as a plain machine, a single speed purpose machine, and automatic power feeds can be arranged on any spindle alternating with built-in tapping attachments. Motor drive of both horizontal or vertical style can be supplied if required.

## NEW TAPER COLLAPSING TAP

The Alfred Herbert, Ltd., Coventry, England, have developed a new taper collapsing tap, and have the following to say upon the subject.

The problem of cutting internal taper threads in pipe couplings and similar work has always been a difficult one. Tapping with a solid taper is an unsatisfactory and primitive method of doing the work, as the whole length of the cutting edges is in operation at the same time, so that a very large amount of power is required to drive the work. Moreover, a number of lines are left in the work where the tap ceases cutting, which makes it difficult to get a good joint.

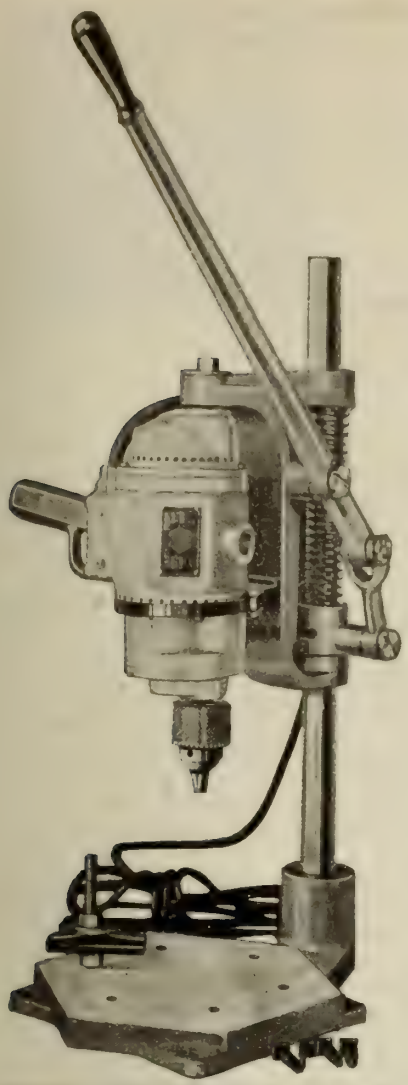


The chasers in this tap are supported on a taper plug, the front end of which projects through and is fitted with an adjustable screw A as shown in illustration. This, during tapping, is brought to rest by coming into contact with a suitable abutment inside the work. The chasers gradually contract in diameter as they slide over the plug, being pressed down on to the taper plug by compression spring B engaging pockets in the chasers, and retained by screws so that cutting takes place only on the cone or lead of the chasers, consequently no more power is required than when tapping parallel threads of the same dimensions.

By adjusting the screw A in or out the diameter of the thread can be adjusted within an appreciable range. At the end of the travel the chasers collapse an amount greater than the depth of the thread so that the tap can be withdrawn without reversing the work. By rotating the knurled sleeve C in the right-hand direction, the chasers are raised by a scroll, whereupon the plug shoots out into the starting position ready for the next piece.

In the illustration, the plug is shown at the right-hand end of the travel, i.e., with the chasers fully collapsed. Where a fine degree of accuracy is required a roughing and finishing attachment D can be supplied so that two cuts can be taken on the work without disturbing the adjustment. The design of this roughing and finishing attachment is similar to that used in the parallel type, style 'H Coventry collapsing tap.

The tap shown was made for taper pipe couplings 5 inches diameter for use on a screwing machine. It was, therefore, made with a flange to bolt to the screwing machine spindle. These taps can be made for taper threads 1½-inch gas and upwards, and are at present made to special order to suit the machine on which they are used, and for the work for which they are intended.



The Canadian office, 1-3 Jarvis Street, Toronto, are, of course, handling this tap in Canada.

DETAIL VIEW OF THE COLLAPSING TAP

## BENCH DRILLING STAND

The Black & Decker Mfg. Co., Baltimore, Md., have placed on the market a bench drilling stand as shown in the illustration. This takes ⅜ in., ½ in., 9-16 in., ⅝ in., and ⅞ in. B. & D. portable drills. The bracket carrying the drill can be raised or lowered on the vertical column and is secured in any position by means of a split collar and clamping screw. The drill may be

GENERAL VIEW OF BENCH DRILLING STAND

swung clear of the base, making it possible to use this stand for such work as applying ring gears to automobile axles, drilling in the ends of shafts, and other work too high to be drilled on the bench. The feed lever gives a feed ratio of 6 to 1.

This concern have also marketed a portable automatic tank outfit, operated by an electric compressor. This blowing outfit, as it is termed, is especially adapted to the blowing away of dust, lint, etc., from motors and machinery in general. It is, of course, used for other purposes such as inflating pneumatic tires, etc., but its chief interest to the machine tool trade is its cleaning qualities, in so far as machinery is concerned.

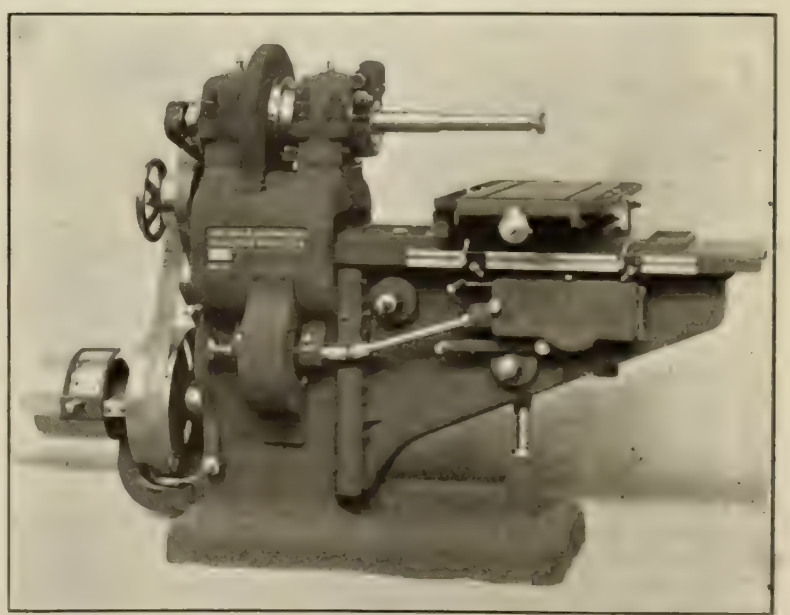
## CYLINDER GRINDING MACHINE

The Heald Machine Co., Worcester, Mass., have placed on the market a cylinder grinder known as their No. 55 style. This machine does away with speed boxes and other expensive units, replacing them with a drive from a single shaft on the rear of machine. It is also self contained, no countershaft being necessary. Naturally, this makes the machine less expensive.

The table is large enough to hold cylinder blocks of six cylinders without large overhang, even when grinding the end holes. The grinding spindle is carried on top of the column in a cylindrical, rotating head made up of two eccentric sleeves, this giving an adjustment to provide for grinding different sizes of holes. The spindle has two speeds, obtained by means of a two-step cone on the main drive shaft. The large, adjustable knee shown in illustration carries the main table, which slides back and forth in a line parallel to the spindle. The ways are protected from grit and dirt, and oil pockets with rolls are provided for continuous lubrication. The travel of the main table automatically reverses, adjustable dogs being provided to allow of controlling the limits of travel. Two speeds can be obtained by means of a knob placed at the front of the machine, and the cross-slide is provided with a hand feed screw fitted with a graduated dial.

The wheel spindle is hardened and ground, and runs in a solid, tapered bronze bearing at the wheel end, with a self-aligning ball bearing at the pulley end. It is fitted with interchangeable pulleys, to give different speeds to the grinding wheels, so that the proper speed for the size of wheel used can be obtained. The depth of cut is controlled by the feed mechanism on the right-hand end of the rotating head. It can be operated either by the knob for small adjustments, or by a small crank on the shaft below the knob when large adjustments are to be made, as when going from one size of hole to another.

Wheel spindles can be furnished to suit work of different types, the type depending upon the diameter and length of hole to be ground. Pump, tank, fan and diamond mounting can be furnished if required.



## AUTOMATIC LATHE

The Rockford Machine Tool Company, of Rockford, Ill., have added an automatic lathe to their line of machine tools. This machine is intended for the rapid production of duplicate parts, such as the turning of pulleys, pistons, gear blanks, etc., where various operations can be carried on simultaneously. It is designed along the lines of their heavy duty lathe and constructed to withstand the severest service. The headstock is cast integral with the bed so as to eliminate slippage. The front or turning head is carried on a 3-inch bar supported in both the front and the rear head. The carriage is supported on the outer end on a hardened way that can be shaped to give the work a taper, convex or concave surfaces. The back or facing head is carried on a bracket on the back of the machine. The movement of the back head is obtained by means of a cam drum operated by rack and pinion. Cams of any desired shape may be mounted on this drum. The machine is supplied with an oil pump for supplying lubricant to the work and cutting tools. The machine can be supplied with a belt or motor drive.

## K. T. TOOLS

The Knanel Tool Works, Rock Island, Ill., have placed on the market their line of tools. These include their adjustable taper caliper and high-speed parallel clamps. The caliper is fitted with a lock which sets the members to any taper desired and allows for duplication. They range from No. 1 to No. 10 B. & S. taper shanks.

The clamps are made of steel throughout and are heat treated to secure proper strength. They are claimed to be absolutely parallel and are said to grip powerfully.

GENERAL VIEW OF THE GRINDER.

# WHAT OUR READERS THINK AND DO

## MAKING TIME ON A SQUARE THREAD CUTTING JOB

By D. A. Hampson

A SHOP that manufactures (manufactures, not makes) square threaded lead screws and screws for jacks and other such purposes has adopted the accompanying fixtures as their standard practice in threading. Precision screws are not turned out, though all of their screws must pass a test with a twelve-inch steel rule—and the commercial accuracy of the product is so high that the rejections from faulty lead are practically nil.

All the threading lathes in the shop are equipped with the same tools, i.e., there are two sizes of cross slide castings—one for larger and one for smaller screws—and each of these sizes takes the cutter blades of a certain range of widths. This standardizing of tools keeps down the initial expense and minimizes the cost of repairs.

Reference to the drawing shows the customary cross slide bearing a tool block on its upper face. Then there is a rear casting A that fits the cross slide ways and is adjusted to any desired position before tightening the gib screws. In addition to this latter fastening, two bolts B are supplied. This makes a rigid fixture, one well calculated to stand the lifting action of the rear cut. Casting A is planed to receive a slide S, having square ways and a slot on top for the tool, or cutter.

The rod R, adjustable from the front of the lathe, joins the carriage with the link at the rear of A—and it is the function of this link to move the rear tool into the blank screw just as the front tool is moved in for a cut by the operator's turning the crank handle, the movements of both tools taking place at the same time and being of equal amount. At the end of the cut, when one tool is withdrawn for reversal or whatever other means is followed for returning the carriage, the other tool backs out clear of the work as well.

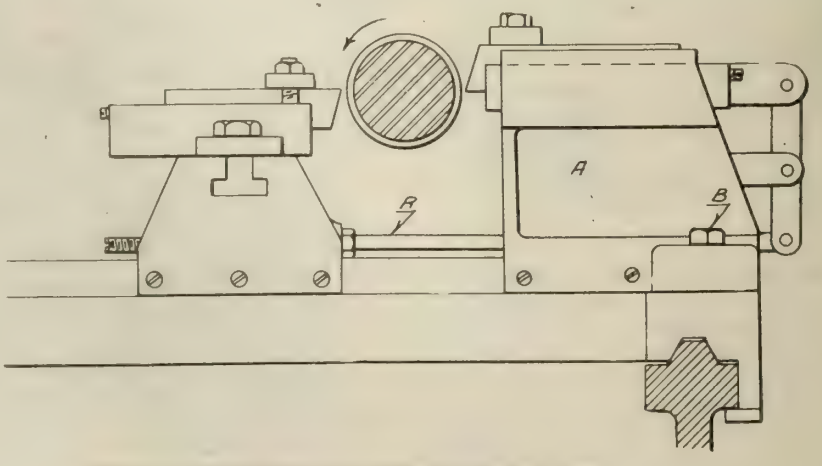
This outfit turns a "mean job" into the production class. The two cuts balance and so avoid that curse of square threading—a buckling screw—which occurs in spite of the rests used. With this rig, no rests are required and two cuts are made at once; it is hard to say whether more time is saved by setting up or in actual cutting. Flooded lubrication is employed.

### Turning a Twelve-inch Crank Shaft

Nothing remarkable disclosed by that heading. The shaft, however, weighed three tons and was not removed from its bearings. Up at the cold storage plant, their oldest ice machine had had a loose balance wheel for years; finally it got so bad they couldn't keep a key in it and arrangements were made to exchange the wheel for a new one—but we were asked to turn the shaft to remove the irregularity caused by years of pounding—turn it straight and send a snap gauge of its diameter to the engine builder.

We had a 20″ planer whose cross-rail was easily detached and this we planned to use for turning. The cross rail would bridge the flywheel pit easily and could be secured near enough to the worn shaft to leave the tool rigid; two brackets to support the cross rail were cast and these were fastened by having a lug on each bracket extend over the caps of adjacent main bearings. When drilled and held down by these main bearing bolts, our rig was complete.

Twelve hours were consumed at the plant—and we had eighteen inches of good straight shaft to show for it. As against any other method, the cost of this was less than the trucking charges for moving the shaft if it was taken out. The scheme of using a planer head for a portable tool is an old one with engine men, but it is always new to others in the craft.



## REDUCING COSTS IN HIGH SPEED TOOL SERVICE IN MACHINE SHOPS

By P. Dyson

During twenty years' practical experience as a mechanical engineer, a great deal of which time has been spent in machine shops both in Great Britain and Canada, I have often been led to wonder, when seeing expensive and still good machines scrapped, and still more costly machines bought to replace them, how comparatively few shops there are that know the comparative production of each machine as judged by actual working. In other words, whether the heavy costs of installing new machinery are always justified when contrasted with the production given by the machines scrapped. To me it seems as if the new machine is set to work, an operator found for it, and there it ends as far as comparisons go with former production.

The object of this short article is to point out, after careful observation, one of the causes of a machine not coming up to expectations on an output basis. I am referring more particularly to the method of supplying high speed tools to the machinists. I will try to illustrate more clearly what I mean by relating what proved to be a very interesting experience some little time ago.

I was employed in the machine shop of the locomotive works of one of the largest railways in Great Britain. A large proportion of the machines had recently been scrapped and replaced by the finest products of British and American machine tool makers and the shop superintendent was determined that the

THIS ILLUSTRATES THE THREAD-CUTTING IDEA.

service of high speed tools to the machinists must be worthy of the machines on which they were to be used. He also decided that no machine should be stopped through a machinist going to the toolsmith or grinding wheel with his tools, and at the same time decided to take away existing grindstones and emery wheels from the shop.

It was given to me to institute a new system of supply which would give satisfaction to masters and men alike. I set out by making myself familiar with the class of work done in all the lathes and on the turning and boring mills, slotters, planers, shapers, autos and borers through out the shop. I next made it my business to get hold of all the available high speed steel in the shop and it was amazing to see the huge pile I collected in the form of broken and damaged tools which were lying in cupboards and under machines. My new toolroom consisted of a high speed furnace together with high pressure blower and pyrometer, whale oil tank, and water tank. The grinding plant consisted of two Lumsden oscillating tool grinders each with a Norton conical grinding wheel and one ordinary disc grinder with table inclined at 6 degrees and racks containing an aperture for every one of the above mentioned machines.

The tools were standardized and a chart drawn out giving the cutting and clearance angles of every tool. Some of the tools were forged, while with others, it was found advantageous to grind them into shape. The rough grinding was done dry on one machine. They were then hardened and re-ground wet on the other machine and the radius finished off on the disc grinder, the inclined table at 6 degrees giving the necessary front clearance angle. Tools were then placed in the aperture in the rack which was labelled with the number and name of the machine to which they belonged and when the system got into full swing it was found possible for every machinist to have a good set of tools by him and at the same time have at least one duplicate set in his aperture in the toolroom rack.

When a machinist had tools that required regrinding he sent them to the toolroom and duplicates were given to the messenger. The others were attended to by the men on the Lumsden grinders and replaced in the rack.

This system was found to be economical and highly satisfactory. The tool steel was worked out to very small proportions. When a 1½-inch square section tool had become too short for use it would be drawn down to a smaller section, and then a smaller section again, and would eventually finish its career by being used up ¼-inch square section for turning copper fire-box stays in an automatic machine. This does not damage the steel in any way, it only requires care on the part of the blacksmith that he does not put it under the hammer at too low a heat.

During the time I was engaged in collecting the old style tools from the machinists it was very amusing to hear the remarks from some of the older hands. One man who had turned piston-rods for the past twenty-five years declared that nobody could grind a tool to do that job except himself. His principal tool was a right-hand sliding tool and when he was first given one of the new products of the Lumsden grinder he put it down with the remark, "No good." However, the last I heard of him was that he had increased his production of piston rods.

From my experience in Canada, I am convinced that the above method could be adopted with great advantage in a number of machine shops over here and I have been led to relate the above experience in the hope that it may help towards this end. That the workmen would gladly co-operate goes without saying, for they know full well that increased production is better for everyone concerned.

## SPECIAL LAMP

The supremacy of the carbon arc lamp in the projector field is being challenged by a special bulb lamp invented by a British firm in which the light is supplied by an electric arc between two small beads of tungsten. An intense point of light is thus obtained. Larger lamps are made with a square plate of tungsten (about half a square inch in area) which becomes white all over and produces a light of as much as four thousand candlepower. Smaller sizes give five hundred and one thousand candle power. For cinema projectors and many other purposes these new lamps are said to have many advantages over the old-fashioned carbon arc. They can be run off any electrical circuit, whether continuous or alternating.

## CIRCULAR SLIDE RULE

In order to assist engineers to calculate the size of pulleys and width of belts for transmission problems, a British firm has developed a circular slide rule by which all the details required can be ascertained with rapidity and accuracy.

In the German city of Hamburg a taxi may be called by dropping a coin into a slot machine. If this idea were in force here we might run out of coppers, judging from the amount of taxis flying around.

## The Need of Information

SEVERAL strikes are pending, others have taken place, and it looks as though much of the metal working world would be involved in troubles over the readjustment of wages to meet changed and changing conditions.

It is hard to ask a man to meet a reduction in wages and it is hard for a man to accept a cut. As soon as he comes into higher wages the chances are that the standard of living in the home comes up to a higher level. There may be a few homes where this would not hold good, but in the majority of cases it would work out that way.

When it comes to the point where readjustment has to be made, there is only one way of taking the keen edge off of a wage reduction and that is by being able to show to an employee that there have been corresponding reductions in the prices of things he must purchase.

The trouble is that this information is hard to secure. The figures used by the Labor Department at Ottawa are not practicable enough. They do not meet the needs of every community. In this country we have no organization that is going into this work as thoroughly as the Industrial Conference Board in United States, the findings of which can be accepted as readily by an employer as by an employee.

In order to deal justly with this condition, there is need right now in Canada for a statistical organization doing work on the plan followed by such firms as the International Harvester at Hamilton. When they desire information as to how much it costs a family of five to live, they work it out in actual every-day practice, making the purchases from the average stores and under average conditions. It has been found possible in this way to arrive at something that will be satisfactory to all concerned, because the men in the shop know it is right and the management have faith in the results.

Many a firm is faced right now with the necessity of making a reduction of wages because present conditions do not warrant the old rate. They will likely make a direct cut of so much all around and the chances are that the amount will be arrived at by trying to figure out how much they can afford or how much they think the men will stand.

We need better organization along these lines in Canada.

---

The composite market average is a quick way to get an idea of prices. This represents the average of fourteen iron and steel products. Over a period of seven years they stand: To-day, $47.10; February 16, 1921, $48.36; January, 1921, $51.73; November, 1920, $63.75; February, 1920, $65.63; February, 1914, $23.52. If you want to know at once how things stand as compared to a year ago, there it is $47.10 as against $65.63, or a drop of $18.53.

## Apprentice and Superintendent

THE superintendent of a large shop signed an order for added equipment a few days ago. He had not been interviewed by any machine tool salesman. He knew exactly what he wanted and he knew the firm he was going to place the business with. But let this man tell his own story:

"Years ago as an apprentice I learned to love machine tools and one of the happiest moments of my life was when, on odd days, I could get inside a machine tool showroom and spend hours going over the new designs that were coming out. One day I was in a certain city and went in one of the showrooms to have one of my treats. A salesman came along and asked what I wanted. Upon telling him he informed me that it was a salesroom and not a showroom. I didn't go home, but went to another place, hoping for better luck. I had not gone very far into that place when I was met by a different sort of salesman. He showed me around and we had a good time together. He made me feel at home and he told me certain things about new lines that impressed me. I was not a superintendent then—simply an apprentice."

There is not a salesman in the business who cannot benefit by that incident. The idea of impressing an apprentice and winning the buying power of a superintendent may not impress you very much, but it is none the less a fact.

It does not require the outlay of much courtesy and attention to make a friend. Being courteous to a non-buying apprentice and winning a superintendent with big purchasing powers is a real, worth-while piece of business.

---

Price tendencies were down this week in several steel markets. The law of supply and demand is at work and greater than that is the desire of a good many steel merchants to clear out their stock. There was more steel held in the country than was generally believed. In a rising market such as prevailed for about a year and a half, terminating six months ago, it is easy to sell, and about nine out of every ten buyers do things they wouldn't do in normal times. The liquidation of high-cost stocks is very advisable, even if accomplished at a loss.

---

There is a marked difference in the coal market now as compared with conditions six months ago. Coal Age this week uses such words as "marking time," "demoralized," "standstill," "glutted," in describing conditions, especially in the soft coal trade. This condition developed very rapidly following the falling off in industry—so quickly, in fact, that one is led to wonder if some of the stories of coal shortage, when demand is good, can stand on all fours.

# Pouring 50 Tons in Less Than 3 Minutes

"WELL, it looks as though it was all over and all right." Such was the modest acknowledgment of our congratulations to the superintendent of the foundry at the Allis-Chalmers Co., Toronto, a few days ago.

Our time-piece had just told us that it had taken exactly fifteen seconds less than three minutes to pour fifty tons of iron into the biggest casting ever made in Canada. That is, one ton went in every three seconds, or pretty close to it. And this casting forms the base for the biggest dynamo ever made in the world. So you can see that in this Dominion of ours, in spite of its lean streaks and its agitators, and those who claim we shouldn't do anything but grow grain here, there are firms forging ahead and doing some worth-while big things.

Making a casting that size is like excavating for a fair-sized house. A glance at the photo on this page will give some idea of the size of the mold. The layman thinks of the molder as ramming away with some sand and cores, all on a fairly small scale. He seldom stops to think that he is called upon to build the place in which 50 tons of hot iron are going to be poured at the rate of about 20 tons per minute—that there must be reinforcements and bindings and safety margins to take care of all the pressure that tremendous weight is going to exert—that the gas that is going to come into existence must be let out and burned.

THIS SHOWS THE SIZE OF THE MOLD, SETTING CORES, ETC. IT IS 26 FEET ACROSS AND SOME 80 FEET AROUND.

And just to make sure that everything was going to stay just as planned, "Jimmy" Craig, the superintendent of the foundry, had piled an extra hundred tons of weights on top just to make sure that nothing went through the roof. The placing of that added weight was simply a precautionary measure. The fact that it was sitting on top of that heap may have had quite a bit to do with said heap behaving itself, for as Mr. Sedgwick, the general superintendent of the plant, explained, "There is really no way to know definitely how much resistance is required to play safe on a job of that size."

There were, for instance, some eighteen bolts 2¼" across and 6' 3" long, holding top and bottom. These were all turned down tight and in themselves out to stand a strain of 300 tons each or 5,400 tons in all. The breaking strain would easily be five or six times as much as the safe working strength.

### It Was Well Done

A person can hardly help admiring anything that is well done. A greenhorn could have gone into the Allis-Chalmers foundry last Friday afternoon and after watching the final preparation for the pouring of that casting and the completion of the work, he would have seen one thing standing out all over the place, viz., organization. There was nothing left to chance. They were not wondering at the last minute if this thing or that had been done. All HAD been done.

One ladle was good for some 30 or 35 tons of metal. There's something mightily impressive in the way the men who live up near the roof in the cranes run their 'bus up and down the shop and drop those ladles where they are wanted almost to the inch. The iron was taken out in ten-ton lots—poured and covered with charcoal to keep out the air. Then in an hour or so the cupola was ready to belch out another allotment of ten tons. And so it took a good five hours' blowing and puffing for those two ladles, one with 30 and another 20 tons to be ready for the last act in making the base for the dynamo that is going to be sent across to the Chippawa power development.

### They Take No Chances

But hold a minute. They're not taking any chances. We climbed the winding staircase to where the cupola was being stuffed—stuffed to the neck on this occasion after those two ladles were filled. Pig, scrap and charcoal was the diet for the day and the chalk marks on the stack indicated the number of helpings of each that had been dished to the big stove that day. "We're not taking chances to-day," said the cupola foreman, "it's no use for the sake of a few tons to risk running short. And so it was that the extra 10 tons was spouted out and the work started on pouring.

Every man Jack of them knew what to do. No person yelled—no person was excited, nor was there any evidence of that abundant "Now all together boys" meddler. It was so still that I heard someone across the shop say, "There she goes" when the first iron hit the pouring basin. Pouring was done from opposite ends, the iron running around in a ditch, with many holes.

Pretty soon the gas started to blow where it had been lit. "She's starting to fill up now," remarked one old foundry man, "and she's all right, too. It's queer how we get used to work like that. I mind not long ago pouring one in Buffalo. It was the first one of that size, some forty or fifty tons. They had the ambulance and fire brigade all tuned up for the occasion. But nothing happened. But believe me, we always feel a bit better when we see a baby like that poured and done for."

Walking the eighty feet around the outside of that mold a few minutes after it was poured, when its stomach and liver and everything else was grumbling and pouring out smoke, gas and heat, one would hardly stop to think about the cooling-off process. In fact it would be very easy to imagine, as the gas was blazing away at the top and forcing its way out of the ground two or three feet distant from the base, and with that mass left in the ditch on top, that it would never get cool again. But even as we squinted at a respectable distance, the superintendent had given orders to start tearing the house down by midnight. That hundred tons excess baggage that was camping on the neck of that iron baby was taken off. Then a certain number of bindings, bolts and strapping had to

# MARKET DEVELOPMENTS

## More Readjustments are Made in Prices

### Local Dealers Give a Lower Figure on Sheets and Plate—Orders For Bar Mill Material Are Eagerly Sought—What Pittsburgh Has to Say About Prices and Conditions

SOME of the warehouses in the steel business continue to mark down prices. Sheets came down farther this week and are at a point they have not touched in the last two or three years. Still the price cutting has not improved the sale and very few are moving. One firm placed an order for well over a car of bar iron this week for stock purposes, believing that the price and service they secured on the order were good enough to warrant them taking on the material. Some reinforcing bars are being sold and other work is under way that will call for a good tonnage of this sort. Dealers all over are out to sell now, in an effort to get their stocks cleared out.

Many stories are heard in the street as to how long the U.S. Steel Corporation will stand by and see the independent operators cut away at their prices and stop the flow of business to their mills. One report says that so many of the large agricultural implement makers have taken on stock at present prices that should the Corporation come along with a cut now it would seriously involve these interests.

Some of the largest makers of machine tools have come along with announcements during the week of reductions in their selling schedule. These vary from 15 to 20 per cent. There is no thought that the new price will stimulate buying, but it is simply an effort of the builders to try and line up with other reductions. Long years of experience have taught the machine tool market that price reductions do not make sales. Machine tools are bought for a purpose and not because they are cheap.

The scrap metal markets are dull yet. Dealers have too much copper on hand, some of the yards being badly clogged with this metal. Any prices quoted now are more or less nominal. Yards as a general thing are not carrying much heavy melting and stove plate and it would not take much added activity to make this class of material much in demand at better prices than are going now. Dealers claim it does not pay to collect and sort this at present values. There is no money being made in the scrap metal business just now and it is probably a fact that the majority of the yards are losing every day they keep open for business.

## MONTREAL BUYERS ARE STILL IN THE MOOD TO BUY FOR ACTUAL NEED

Special to CANADIAN MACHINERY.

MONTREAL, March 3.—When are we to have a return of that confidence in business that insures a steady movement of all lines of commodities? Upon this question hinges the duration of the present period of trade depression. The solution of the trade problem is—to buy. So long as buying is restricted or even curtailed, just so long will dullness prevail. Every line of industry is more or less affected by the non-buying attitude, a factor that tends to unemployment and underproduction, and consequently high prices. The metal situation is the key to all other activities; therefore, it is essential that this market be stabilized before a return to normal can be attained. Reports from every quarter point to the continued attitude of conservative buying.

### Steel Dull and Unsettled

Steel conditions in this district reflect the unsettlement that prevails both in this market and that existing in the States. Dealers here state that they do not know where they are at. This is the result of the action of many mills, particularly those on the independent list in the States, of quoting prices considerably below the market, and as one dealer remarked: "They are not justified in taking such a stand, as these prices are very often much below what it costs to produce the material." However, it seems to be a question of "getting the orders" and if lower prices will effect this, then quote it. This may seem like a reasonable attitude, but it has the tendency to augment the uncertainty that has pervaded the market for many weeks past. "Consumers are not buying," said the dealer, "except for actual needs. If a suggestion is made that material will probably be needed for spring and summer requirements, the reply is invariably along the lines of 'the future will take care of itself.' Railroad buying is almost exclusively for repair work; material for new construction is practically nil. Shipyards are taking very little. Orders for single plates are now more common than tonnage placements."

Despite the continued dullness, however, there is still the old optimism that improvement will come soon. True, there appears little to substantiate such claims, but this belief of better business is an encouraging factor. A steel dealer here stated that more orders were received last Saturday than on any previous day for several weeks, and the greater number were of the urgent variety. "Our experience," he stated, "confirms us in the belief that very many consumers in every line of activity are carrying on with as small a surplus as possible, covering only when necessity requires, content even to hold up production while waiting on delivery. This attitude is one that prevents a speedy return to normal business, but at the same time proves that the needs of industry are such that business would be rapidly accelerated should anything like normal activity be resumed on short notice." The movement of boiler tubes, while light, is quite active when compared to the sales of other lines. There has been a recent reduction on tubes, these declines averaging about 5 per cent., the greatest reductions being on the lap-welded tubes; 1 3-4 inch l.w. are now $27.50, and 4 inch are $55.50. Two

inch seamless are quoted at $29.25, a decline on previous prices of 5 3-4 cents per foot. Sheets and plates are very quiet, with prices unsteady.

### Dealers Seek Information

"Well," said one scrap dealer, "the present is a trying period, and one requires to have considerable faith to keep his office open. We are now carrying on business at a loss and anticipate this condition for some time to come. None the less, our expectations are for a gradual return to greater activity. Sufficient trading is maintained to keep us interested, but receipts are low—very low. We are pretty well stocked, but are reluctant to seek a market at prices that would mean a heavy loss to us. We are not seeking material for the same reason. Until the market is more active we will assume a passive attitude. The prices quoted may as well stand as they are, although weakness may develop."

## A FEW STOCK ORDERS PLACED

**Buyers Believe Present is a Good Time to Place Business—Some Prices Down.**

TORONTO.—There is some evidence here and there of business coming in for machine tool houses, for iron and steel merchants, but it is still pretty well scattered, and buying is done only after very close scrutiny. One dealer expressed a view that probably sums up the ideas of a good many in the business: "The present market is making more hard buyers than ever existed before. They seem to know that we want business, and that we are inclined to get right down on the mat and pull off the best terms possible. It is spreading, too. We have firms on our books whose business we have simply received as a matter of course for years. Only this week we got a letter from them asking for quotations on several items that in the ordinary course of trading they would have turned over to us without a thought about the price they would be paying."

Prices remain pretty much where they have been in the machine tool market. The belief seems to be held that there will be no move to put machine tools any place near the pre-war price. Some of them have not gone up as far as others. One warehouse was showing a shaper this week and the question arose regarding the comparative price of that machine to-day compared with pre-war times, when the dealer stated: "It used to sell at the factory for $405, but to-day the price, with exchange and 27½ per cent. duty added, makes the tool worth about $1,200."

This same dealer held that it was not desirable that prices should come down to old figures—in fact, he held that it was impossible.

Small tools are being sold in pretty much the same way. Orders are quite numerous, but they are small, although one hears of a few orders being placed for stock by some of the larger users. This market has also felt the work of the man who wishes to cancel his order. One firm had a number of special drills made, and they were of such shape and design that were they to go back to the maker they would have to remain on his shelves waiting for some other queer demand to come along and take them out, the chances very much inclined to them remaining indefinitely. Failure to cancel the order has cost the dealer his chances of getting any more business from that source.

Prices remain the same on all lines of small tools, and the indications seem to point to them remaining there for some little time to come, although there is a willingness on the part of some of the offices to pare a little on a good-sized order. The National Railroads have some specifications out yet that have not been placed.

### The Steel Market

Whether the dealers admit the fact or not, there is a merry little war going on now when any fair-sized order is let loose in the steel market. Dealers are anxious to get cleared out of stock. They feel that they are going to buy to better advantage later on—in fact, they can buy now much better than they could a few months ago. So if a chance comes along to make a good hole in the stock they are carrying they are going to cut their earnings pretty close in order to make the hole in the stock.

There is a certain amount of material going out now for building operations, although it is a little early to sell much reinforcing steel. Some Government work has been allotted and bars were required for that. Other large work is under way, and some pretty good-sized tonnage is certain to result.

The warehouse generally relies on the small machine shop to send in a certain amount of business in bars, but just now this trade is not coming in, and orders are short to that extent.

Tube prices in this district remain where they have stood for some months back. In fact, tubes are still at the same price they were a year ago.

### Placing a Stock Order

That thing most rare for a long time past has started to show up in the market again, viz., the good old stock order. Yes, he is in our midst, but is a little wobbly yet. Still, it is regarded as a good omen that he is venturing out. One firm that has a good-sized machine for doing its own work bought a large car lot during the week, and took the material home at a pretty close price. It's a buyer's market all right, and some of the buyers are beginning to take notice of the fact that this situation is not going to do them much good unless they go ahead and take advantage of it.

Sheets are very quiet now. They have been marked down again to keep them lined up with other classes. Black 28 are quoted at 6.50, and that is probably the lowest price since the last days of 1917. There was no warehouse price that could be counted on absolutely in 1918-19, while for the most part during 1920 it was a case of buy where you can get served and find out about the price afterward.

Plate is moving out decidedly slowly. One mining company came in a short time ago with an order that put at least one warehouse all right as far as its stock is concerned.

At another office the report was that inquiries were improving, if anything, and that several car lots were being

## POINTS IN WEEK'S MARKETING NOTES

**Reductions were made this week in the prices of sheets and plate in Toronto warehouses. Sheets are at a lower price now than they have been since early in 1917.**

**Several of the large makers of machine tools have sent out announcements of reductions in their selling schedules. These will amount to between 15 and 20 per cent.**

**One large order for bars was placed this week for stock. The buyer in this case decided that the price he received, together with the good delivery, warranted him in laying in his requirements out of the present market.**

**The scrap metal market continues about the same as it has been for the past five or six months. There is every reason to believe that dealers are quite correct when they claim they are losing money every day they are in business on the present market.**

**There are not very large supplies of heavy milling steel for stove plate in any of the scrap yards now, and there should be a pretty fair demand for these later on. Dealers claim that it does not pay them to collect and sort this class of material at present prices.**

**Small tool dealers report only a fair amount of business coming in, and this is made up largely of small orders.**

**Pittsburgh reports that the United States Steel Corporation is now operating at about 65 per cent. capacity, and that next week will see this figure still lower.**

placed. There was, in the opinion of this office, a better buying tendency than there has been since the first of the year.

**The Scrap Metal Trouble**

There's very little joy to be found in the scrap metal market this week, or any week for a long time past. "The longer we keep open the more we lose," was the view of one pessimist this morning, but one never expects to find much visible joy in the scrap metal market. The copper surplus in United States markets continues to increase. A week or so ago the producers got a loan of $40,000,000, placing as security against that 400,000,000 pounds of copper. "Electrolytic is quoted this morning," remarked a dealer, "at 12.75, but I know very well that it can be bought for 12.50 if one were to get out and buy. The market has got out of the hands of the producers, or the dealers, or the buyers themselves, for that matter. It is any person's affair just now, and there does not seem to be any step that would stabilize it."

There is a fair demand for heavy melting and stove plate, but the price is so low, claim the yards, that it would not pay them to have men collect and sort it. Yards are for the most part pretty well cleaned out of iron and steel. Were they as barren of coppers they would be in much better shape than carrying, as they are, large stocks of this metal.

## MORE CHANGES IN TOOL PRICES

**Some of the Big Makers Are Out Now With Cuts of From 15 To 20 Per Cent.**

Special to CANADIAN MACHINERY.

NEW YORK, March 3.—The meeting of the National Machine Tool Builders' Association in Cleveland last week was devoted mostly to a discussion of the cost of doing business in the industry. The executive committee of the association presented a uniform cost finding method, which has been devised by a firm of accountants, Scovell, Wellington & Co., Boston, Mass., after careful investigation throughout the trade.

The machine-tool trade is of the opinion that interesting developments in the price situation may be expected shortly. At the Cleveland meeting it was announced that two of the leading machine-tool builders, the Brown & Sharpe Manufacturing Co. and the Cincinnati Milling Machine Co. had reduced prices 15 per cent. Reduced prices are now in effect on nearly all well-known makes of grinders, shapers, engine lathes and precision lathes. In some instances manufacturers have not formally reduced their prices, but in competition have met the cuts of their competitors.

Developments in the market so far as business is concerned are very meager. Domestic business is almost at a standstill, although occasional orders for single machines are being placed. In foreign trade the principal buying is from Japan and India.

## A BIG BUYER IN THE MARKET MIGHT SET A NEW LOW PRICE

Special to CANADIAN MACHINERY.

PITTSBURG, March 3.—The finished steel market continues stagnant. There is scarcely any inquiry and thus the mills cannot get much business and do not even have much opportunity to endeavor to get business by making further price cuts. The position of most independent mills is that they would gladly quote lower prices than have yet been named if thereby they could secure reasonable sized orders and by the term they do not mean really large orders, but rather orders for say 1,000 tons at a time in the heavy rolled products and even less in the lighter materials, like sheets.

Declines in prices in the week have been small. Plates, which were quotable a week ago at about 2.25c as minimum, against the Industrial Board and Steel Corporation price of 2.65c, have been quoted at 2.10c, and the producing interest which quotes this price will not say how small a tonnage need be offered to induce it to quote it, while intimating that on a really large inquiry a still lower figure would be named. Shapes are quotable at 2.25c, the same as a week ago, the old price having been 2.45c, but the lack of a lower price on shapes seems to be due simply to there having been no inquiry to bring out a lower quotation. Bars were quotable a week ago at 2.00c, the old figure having been 2.35c, and may still be quoted generally at 2.00c, though it is known that in some special cases 1.95c and even 1.90c has been quoted, while in some quarters it is believed 1.85c could be done if there were the right sort of inquiry.

In sheets there are definitely lower prices. Blue annealed sheets are still quotable at 3.20c against the Industrial Board price of 3.55c, but the 3.20c is practically nominal, awaiting inquiry, and the heavy gauges can be bought at much less, as they could be bought at a plate mill price, say at 2.10c plus an extra for their being under ¼-inch thick. Black sheets can easily be done at 4.10c, against 4.15c quoted a week ago, and an Industrial Board price of 4.35c, while it is believed 4.00c could be done and perhaps shaded a trifle on a really good order. Galvanized sheets have been quoted even in small lots at 5.25c against 5.35c a week ago and an Industrial Board price of 5.70c.

Standard steel pipe seems still to present a firm front, so far as the mills are concerned, but it is reported that some jobbers, particularly in the East, are offering to sell at mill prices. Tin plate likewise has not been shaded. These two are the only lines that remain at Industrial Board prices.

The Steel Corporation has made no reductions, but adheres rigidly to the Industrial Board prices, just as it did all through the period when the independents were readily securing much higher prices.

**Buyers Apathetic**

The record of prices and price declines, however, is of little significance and of no particular interest. As to market conditions it does not matter what prices chance to be quotable, as there is no market in the sense of there being activity. It would make very little difference in the year's earnings of producers or consumers whether the material now being sold were at $10 a ton higher or $10 a ton lower than the prices that are just now quotable as the market.

Buyers are taking no interest in prices. There is nothing like a deadlock. Buyers are not waiting for lower prices, nor have they any particular prices in mind, at which they would be disposed to buy.

The really interesting feature of the situation is the relation between the Steel Corporation and the independents, which was referred to at some length in last letter. The independents evidently wanted to force the Steel Corporation to reduce wages, but the corporation refuses to take action. The independents did not, presumably, wish to force the corporation to reduce its prices, though obviously the corporation must eventually do so. Apparently they did wish to curtail the flow of steel from the Steel Corporation to its customers, as the existence of this steel, much of it going into stocks, would tend to detract from the quantity the independents would be able to sell later.

Last Friday a circumstantial report emanated from Youngstown to the effect that the Steel Corporation was to have a meeting that day and the next of the sales managers of the subsidiary companies, to consider making price reductions. The newspaper reports quoted officials of the Steel Corporation in Youngstown without giving names, also a prominent independent steel official, name also not mentioned, all commenting on this meeting, yet there was no meeting. The sales managers who would constitute the meeting were to be found at their desks in Pittsburg both days. The presumption is the report was conceived by independent steel men rather than by newspaper men. From various circumstances it is plain that the steel industry is not entering an era of good feeling between the various producers.

**Operations**

The Steel Corporation could not logically reduce its prices when it still had a high operating rate, based on old orders, but the cutting by independents has caused many customers of the corporation to instruct that shipments be curtailed or discontinued, and the cor-

poration operations are decreasing rapidly. They were about 75 per cent. of capacity week before last, against about 92 per cent. in the first fortnight of the year, and last week they probably did not average over 65 per cent. This week will naturally show a still lower rate, and so on. The decline paves the way for the corporation to reduce its prices, and, of course, the corporation will reduce wages when it reduces prices or soon afterwards.

Practically everywhere it is admitted that the independents are operating at under 25 per cent., and one observer with good facilities for ascertaining the facts estimates that the rate is under 20 per cent. In other words, the independents are not running as well as when they started to cut prices, although they might be no better off if they had not cut prices. The one noteworthy result of the price cutting is the great decrease in the Steel Corporation's operations.

Foundry pig iron has quietly slid off a dollar a ton, $27, valley, being now the accepted market price, Bessemer remaining at $27 and basic at $25. These prices are more or less nominal, and certainly they are not supported by any buying to speak of. The prices are much below the cost of production, based on the cost of the large quantities of ore the furnaces have, purchased at last season's prices, and recent prices for coke. It appears now that the pig iron price will make the ore and coke prices, rather than the other way, and of course furnaces have to absorb the loss on the ore already bought. There is no interest in coke as to actual purchases, and little interest as to the future, the point about coke being that eventually the Steel Corporation will no doubt reduce wages all around, including wages in the Connellsville region, and then the other operators in the region can reduce also. When the new wage scale is in force it will be possible to figure how cheaply coke can be sold. The market is nominal just now, with spot furnace at $4.50 and contracts at $5.00. Some operators ask more, of course, but even those with the lowest prices do not effect sales. Spot foundry coke is quotable at $5.50 to $6.50, depending on brand, all prices being per net ton, f.o.b. Connellsville ovens.

## Pig Iron Market

The general tendency in the pig iron market is still downward. Some rumors of very low prices have not been confirmed, but their influence has had a depressing effect on the market. The reduction last week in the Pittsburg district of standard basic iron to $25 by a merchant interest has not resulted in any appreciable increase in demand. One company in this district has disposed of some off basic at $24.50, furnace, part of the tonnage going to a Homestead melter, the price in this case being equal to about $24 valley furnace basis. Basic is being quoted at $25, and No. 2 foundry at $27.

Chicago reports that business has been very light during the past week. Although it is possible that better prices can be obtained no orders have appeared to bring out such quotations. Delivered at consumers' yards—southern foundry, sil., 1.75 to 2.25, is being quoted at $34.17, and basic at $28 to $29.

The Birmingham iron market seems to have steadied itself since the establishment of the $27.50 level, and none lower had been heard from up to the close of the week. One furnace interest booked about 1,500 tons of iron during the week at $27.50 to $30, much of the $30 business being acceptance on quotations previously made. The leading interest continues to ignore the general market. Although the indications have been brighter, indications seem to point to a stronger effort to hammer the market down to $25.

The volume of business on the books and in prospect in the Buffalo district is so small that it has been remarked by one sales manager that he has not seen such stagnation in the iron trade in 30 years. Increased business was expected on account of the heavy inquiry two weeks ago, but this has not been realized. Reports are current of furnace iron sold at less than $30, but verification is lacking. No. 2 plain, 1.75 to 2.25 silicon, is quoted at $28 to $30, and basic, nominal, at $30.

On the St. Louis market foundries are doing a little work and are taking an occasional carload, but this is about all the business being carried on.

The market at Cleveland shows little life. Lake furnace prices on foundry iron have declined $1 a ton to $28, at which several small lot sales have been made. An inquiry has been made for 1,000 tons of foundry iron for prompt shipment by the American Radiator Co., for its Detroit and Titusville, Pa., plants, also an inquiry for 1,000 tons for second quarter, but it is understood the latter inquiry was sent out to obtain prices for use in quoting on castings. There is a considerable amount of resale foundry iron in the market and it is being offered from $1 to $2 a ton below the prices asked by furnaces.

The New York market is still extremely dull, with indications of further weakening. A sale was made of 1,000 tons of foundry grades last week at a price that is understood to be equivalent to about $27 eastern Pennsylvania for No. 2 plain, and less than $25, Buffalo, but no sales of Buffalo are reported at less than $28.

That buyers are a little more confident as regards the present quotations on the Philadelphia market is shown by a few more sales of 500 and 1,000 ton lots. One eastern furnace took a 1,000 ton order for February-March shipment at $29, base furnace, and a 500 ton order at the same price for the same delivery.

## Scrap Metal Market

The scrap metal market is still lifeless and prices continue to show weakness, though dealers believe the bottom has been reached.

Chicago reports that if the market could be any duller than it has been for some time past, that is the condition during the past week. Except for tonnages bought to apply on unfilled contracts for the Gary plant, dealers have practically no outlet for their material, and shipments to that destination have been almost enough to cover its requirements. As a result dealers are again accumulating scrap in their yards. Quotations on many grades have been lowered 50 cents to $1 per ton during the past few days. Heavy melting steel remains at $15 to $15.50. Railroad offerings are not as plentiful as has been the case.

Owing to the necessity for small dealers to raise cash, an increasing number of sales of scrap were made during the week on the Boston market. The larger dealers, without exception, are buying all tonnage that appears at concessions. The foundry demand in New England continues slack. No. 1 machinery sold during the week at $23 delivered. The price of railroad wrought, based on several recent sales, has advanced from $15 to $15.50.

The heavy snowfalls in New York have brought operations in the New York district to almost a standstill. Prices have been unchanged, although some weakness is reflected in cast scrap, of which there seems to be an unusually large supply at this time.

At Philadelphia dealers are inclined to refuse bids on large tonnages of scrap offered at the current prices. A couple of mills inquired for heavy melting steel at $14 and $14.50, but were told that large lots could not be had at these prices. However, it is not certain whether or not the mills would have bought even if they could at these prices. Small lots of heavy steel continue to sell at $14.50 delivered.

On the Pittsburg market No. 1 cupola cast is quoted at $22 to $23. Some demand is current for heavy breakable cast, but there seems to be a considerable shortage. Recent small sales of cast iron borings and shovel turnings have been made around $12.50. Prices have been reduced as follows: Cast iron borings, from $12 to $13 to $11.50 and $12.50: shovel turnings, from $12 and $13 to $12 and $12.50.

Buffalo reports an extremely dull market. Mills figure that the bottom has not been reached, but indications point that it has, and many dealers are speculating on this. It is believed that few dealers would care to sell large tonnages at $15.

The market for scrap continues quiet at St. Louis.

# GERMAN GOODS ARE FINDING THEIR WAY TO CANADIAN MARKET

The menace to Canadian industry from Germany appears to be not only real, but immediate, according to the Canadian Reconstruction Association, and while Germany is making a moan about her ruined industries, she is at the same time trying by every means in her power to regain the position in the world's trade she occupied before she plunged the world into war. The United States Department of Commerce has reports from Argentina showing how the Teuton is underselling American firms, a concrete instance being in the respective quotations for 10,000 car wheels. In Mexico, German manufacturers are offering hardware at 25 per cent. lower than U.S. firms. The low exchange situation, to some extent, explains the matter, but high exchange countries like Canada and the United States are menaced by countries whose currency is greatly depreciated in international trade.

**Perfect Industrial Machine**

In a recent statement, a British government official said that "Germany is still a perfect industrial machine, running at low speed, it is true, but undamaged as yet in its vital parts, and would respond readily to any stimulus. The Guaranty Trust Company, of New York, which has just issued an analysis of "German plans to extend foreign trade," written by the assistant manager of its international trade department, quotes this statement:

"German exports for the first five months of 1920 were valued at 23,688,000 marks as compared with 10,057,000 marks for the entire year of 1919. For the eleven months ending November, 1920, the United States imported from Germany imports valued at $84,000,000, as compared with $10,608,141 for the entire year of 1919."

German imports into Canada for the eight months period ended November 30, 1920, were valued at $725,322, as compared with a value of $11,862 for the corresponding period of 1919.

German salesmen in great numbers are at work in all parts of the world offering low prices and long credits, with quicker deliveries than their rivals. Before the end of last year English warehouses were filled with German toys, which, with the exception of dolls, were generally at about the same price as toys of British manufacture.

---

American railroads are said to need 12,000,000 tons of rails to restore them to pre-war condition. This tonnage, representing a deficit, must be supplied over and above the normal consumption.

# STEEL EXPERT DIES AFTER OPERATION

**C. E. Duncan, General Superintendent of Algoma, Was Sick Only a Few Days**

Sault Ste. Marie, Ont.—C. E. Duncan, general superintendent of the Algoma Steel Corporation, died here following an operation for appendicitis. He had been ill only a few days. Mr. Duncan was forty-eight years of age and was born in Chattanooga, Tenn. He learned the steel business in the Homestead works of the Carnegie Steel Corporation, where he mastered every branch of the trade. Throughout Canada and the United States he became recognized as an authority. He first joined the Algoma Steel Corporation in 1909 as general superintendent and worked in that capacity until 1915 when he entered the service of the United States Government as adviser in large plants. When the late David Kyle died here last spring Mr. Duncan succeeded him as general superintendent of the Soo mills. Mr. Duncan's death is deeply regretted by his business associates, for his death means the loss of an exceptionally brilliant and successful steel man. The remains will be taken to Johnstown, Penn., for interment.

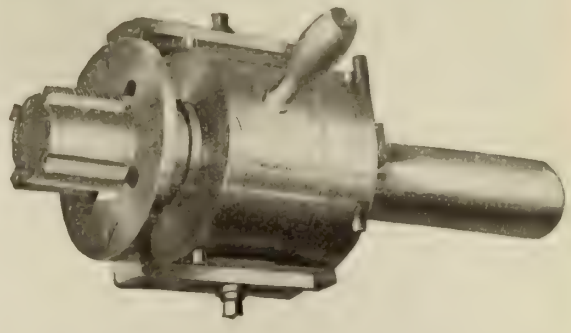
# GEOMETRIC

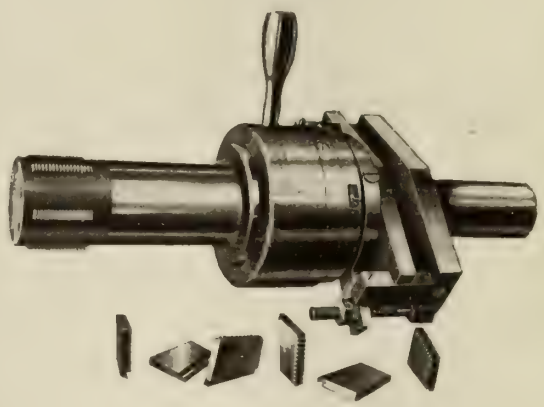
## Adjustable Collapsing Taps

Have overcome all the expense and annoyance of tapping screw threads with a solid tap.

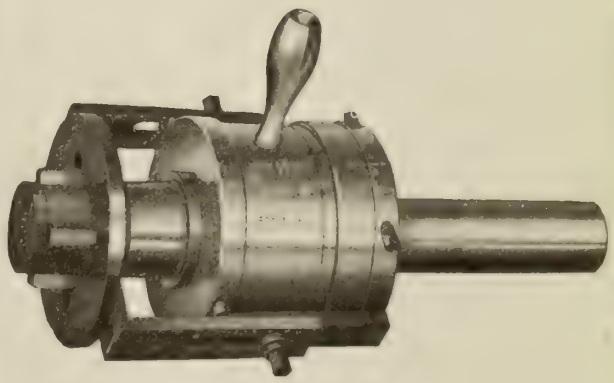
Anyone doing thread tapping knows what backing out a solid tap each time means. It usually means low production, poor threads, and worn-out taps. The mechanism of the Geometric Taps takes care of adjustment to correct diameter each time a thread is tapped; it collapses the chasers automatically, leaving a thread clean cut and perfect.



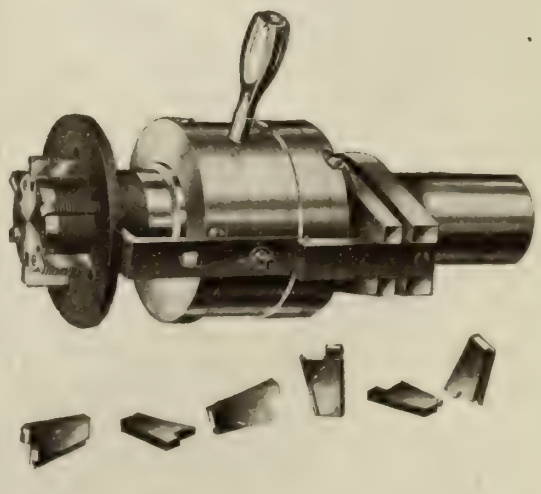
The chasers are readily reground, and when finally used up, are renewed at comparatively small cost, leaving the tap as efficient as when new.



---



The manufacturers of the Geometric line of Collapsing Taps and Self-opening Die Heads are justly proud of the distinction which is theirs:—



**The Originators**
**and the**
**Largest and Best Known Manufacturers**
**of**
**Automatic Threading Tools**

***For cutting all classes of screw threads, internal and external, of any diameter and form***

# Machine Tool Builders Meet at Cleveland

## Matter of Costs Gone Into at Great Length—By Interchanging Ideas and Experiences the Going Can be Made Safer For All —Prices Likely to Decline

THE National Machine Tool Builders' Association, although at first announcing their next meeting at Atlantic City in May, held an important gathering in this city last week, extending over several days. E. F. DeBrul, the new general manager of the association, planned the gathering, considering there was sufficient of importance to discuss and bring before the members without waiting for the May meeting. Judging from the nature of the subjects before the meeting it was deemed advisable to bring the matter of costs, scientifically studied, to the attention of the members before they embarked upon a selling program based on altered prices.

The fact that the members of the association saw the wisdom of the move was well set forth in the attendance at the meeting. The notices were only sent out on February 7, and even on such short notice there was an attendance of 165 members, which sets a high mark for any similar gathering. All sessions were held at the Cleveland Hotel, and nearly all behind closed doors, only members being admitted. There were several reasons for this. The gathering was for the benefit of the members, and it was felt that by allowing none others to attend the sessions would be held more to topics of common interest. The closed sessions were also counted on to draw forth more frank discussion, and this was what the meeting desired above all else. E. F. DeBrul, general manager of the association, and C. Wood Walter, of the Cincinnati Milling Machine Co., formed the press committee.

Practically all sessions on Thursday were taken up with the one matter of "Cost." Mr. Scovell gave the report and findings of the investigation of the Scovell-Wellington Co., cost accounting experts. These covered a very wide range and from them recommendations were made to the association. Following up the same idea, the question of "Overhead" will be taken up at the next meeting in Atlantic City. The afternoon session listened to an address by F. A. Geier on "What Constitutes the Fundamentally Sound Finances for the Machine Tool Business." One point brought out here was that very little outside capital ever found its way to the machine tool business, on account of the big risk and the low returns that had been made in many firms.

J. B. Doan, of the American Tool Works, also gave a talk on the present business situation. To E. J. Kearney, of the Kearney & Trecker Co., was given the very delicate topic of discussing the "Running of a Machine Tool Business in a Period of Depression," in which he went extensively into matters of finance connected with the business.

### Some Pleasing Events

Two presentations were made by the members of the National Tool Builders' Association during the day. A handsome silver service was presented to the retiring general manager, Charles Hildreth, the presentation being made by W. A. Viall. In the afternoon some of the members went out to the home of George Merryweather, of Motch & Merryweather Machinery Co. During the war Mr. Merryweather was one of Uncle Sam's dollar-a-year men, acting in the capacity of a purchaser of machine tools for war purposes, and the members felt that they should show their appreciation of the services rendered by one of their number. The expression took the form of furniture for a well-appointed den. A banquet was held in the evening.

### The Work of the Association

Friday morning was taken up largely by Mr. DeBrul in discussing the activities of the association. He outlined at length some of the things he considered should be included in the work for the coming year. Charts and graphs, indicating the trend of business activity, supply and demand and the law of averages were gone into minutely. The value of interchanging ideas, statistical information, and other like matter was referred to very directly. The speaker pointed out that years ago the early navigator could run his vessel around in the waters where he was well acquainted. He could make his own little chart for his own little route, but he had to stay right there, and every time he ventured out it became for him a big adventure. But now every rock and channel had been charted through the interchanging of ideas and information, and a captain can sail in strange waters with perfect safety. The only thing necessary is that he shall be able to rightly interpret the charts.

Mr. DuBrul believed that if he were supplied with figures for the next fifteen years it would be possible to compile business charts, which, by taking lessons from the laws of averages, over-stocking, over-production, and therefore cancellations, could do much to correct the resulting evils from these conditions. The present conditions came as the result of ignoring certain well-known laws, and by following the crazy system—if it could be called a system at all. He believed in supplying even the customers with copies of these charts, so that they could more intelligently carry on their business. The course of iron through the year was referred to. At the start all was booming, with stacks working to capacity and sales away up on the percentage chart. And so they drifted on down through the year, but all of them ended up in the dumps in December with sales next to nil. By the use of charts, stocks could be liquidated, thus steadying the market at the most necessary time.

The matter of prices was mentioned several times, but no concerted action will be taken, nor would it be possible to move in this direction, as such action would bring the association within the phase of the law dealing with price-fixing. Members were rather reticent in mentioning this matter, but enough could be gathered to leave the impression fairly well fixed that a movement downward is going to take place, in order to conform with the present prices of other commodities. None of the members believed that such a move would tend to increase sales in the least, most of those with whom your correspondent discussed the situation holding that machine tools were bought because the buyers wanted them for some particular purpose, and not because they were down in price.

### Conditions Abroad

At the Saturday sessions H. B. Krant, of Ryerson & Sons, Chicago, who has made several trips to Europe during and since the war, and who has just recently returned, gave a talk on conditions as he had found them, with special reference to their application to the machine tool field. He discussed conditions in England, France, Germany, Norway, Sweden, Poland, Italy, Greece, Russia, and ended up with Roumania. Although conditions were much better now than they had been in those countries, the speaker was of the opinion that there was not much hope for a good market in those counties for some time to come. Exhausted credits and rates of exchange were all against the U.S. selling in Europe.

In the closing meeting Mr. DuBrul also dealt with the need for more education, this service to be rendered by the association. Special reference was made to the method of cancellation that was becoming far too common in business. These losses were largely caused by over-production, and over-buying, due to not having proper statistics and a correct knowledge of the consuming power of the buyer.

The Atlantic City meeting of the National Machine Tool Builders will be held as originally planned.

## WILL CORPORATION REDUCE PRICES?

**Considerable Speculation Going On As To Why This Move Is Not Taken**

Is the United States Steel Corporation likely to reduce its price in order to meet the price slashing that is going on among the independent producers? Judge Gary says prices will stand, but there is a growing feeling that prices are not going to stand very long. There are all sorts of rumors in the steel markets as to why the Corporation adheres to its schedule of March 21, 1919.

One of the most likely seems to be that some of the largest customers of the Corporation have taken on large tonnages at present prices, with a view to using them for carrying out certain manufacturing programmes. Whether this would refer to agricultural interests especially is not certain, but it would seem reasonable to suppose that it would. The fear is expressed that were a lower price brought out—and it would need to be appreciably lower to keep pace with the cutting of the independents—it would cause considerable financial embarrassment to some of these large customers. It would, in fact, more or less cut the ground out from under their feet.

Of course there are well defined limits in Canada to which prices can be cut, before coming under the operation of the dumping clause. A United States firm must sell its product in Canada within 5 per cent. of the reasonable market price in the United States. Of course it can go as much higher as it wishes, but just now the tendency is to get down instead of up. The Steel Corporation capacity of operation continues to get less each week. One very good authority says that they are not running much over 65 per cent. of their capacity now, while the independents are down to around the 20 per cent. mark. The cutting of prices has not resulted in new business being brought into the market.

---

A reduction in wages was made by the Nova Scotia Steel and Coal Co. at the Sydney Mines plant. About three hundred men were affected by the decrease, which is said to have been necessary in order to keep as many men employed as possible.

## TECHNICAL MAN JOINS SALES FORCE

**F. J. McCarty Now In Charge of Morrow Company Business In Montreal**

The John Morrow Screw & Nut Co. have opened their own warehouse and office in Montreal at 489 St. Paul Street West. It is interesting to note that once more the technically trained man is coming into his own in the field of selling, for F. J. McCarty, A.S.M.E., now in charge of the Montreal office, has come up through the mechanical end of the business.

It is easy to say that it hardly pays to learn a trade now, but just go and ask

F. J. McCARTHY, A.S.M.E.

Mr. McCarty if his technical training is of any use in the selling business. He will soon tell you that it is. Mr. McCarty graduated from the Springfield Technical School in 1904, and then went into practical work in the tool room of the National Needle Company, Springfield, where he finished. We next find him in the experimental and automatic department of the Singer Manufacturing Company. Later he was promoted to the designing of new tools and machinery. Then with the Standard Oil Co. as chief draftsman and designer. Mr. McCarty's first acquaintance with Canada was on the sales force of the Standard Oil Co. In 1910 he joined the Tait-Jones Company, Pittsburg, but still worked on the Canadian field, and during this time was admitted as a member of the A.S.M.E.

In 1915 Mr. McCarty went with the Rudel-Belnap people, at the Montreal office, specializing on heavy machinery, special equipment, and drills. At the first of the present year he went with the John Morrow Co. as eastern representative and manager of the Montreal office.

Mr. McCarty has always been a student of mechanical affairs. So far as Canadian Machinery can learn, he has never had the peculiar sensation of being "fired," lives in Montreal and is bone dry, works hard, expects results, and gets them.

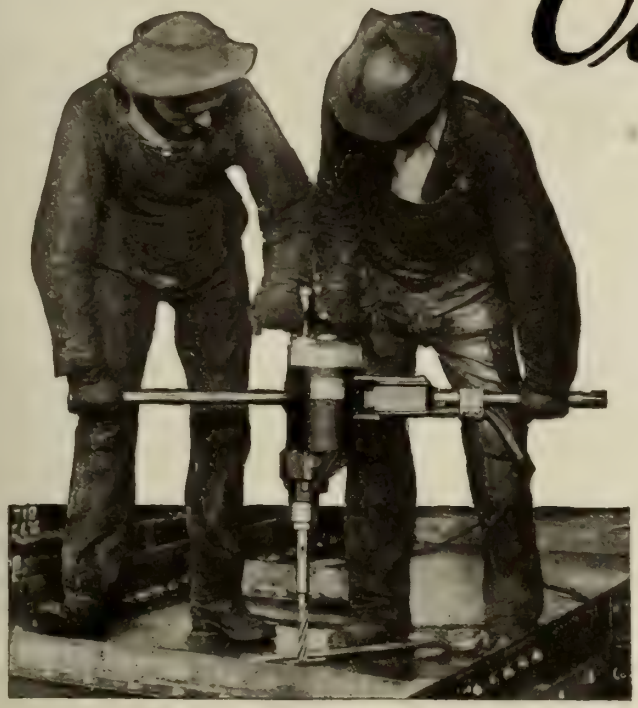
---

## DECREASE SHOWN IN NET INCOME

**Annual Meeting of Canada Foundries and Forgings Held At Brockville**

The annual meeting of Canada Foundries and Forgings, Ltd., was held at Brockville on February 22, and several changes were made in the personnel of the directorate, among which are several new names. A heavy decrease in net income in 1920 was shown in the statement submitted to the shareholders. After allowing the usual deductions, including bond interest and other miscellaneous expenses, but before the payment of 7 per cent. dividends on the preferred stock, there remained a balance of $90,861. The balance available for application to preferred dividend requirement was equivalent to approximately 8.6 on the $960,000 of senior securities of the company outstanding. After disbursing the full year's dividends on the preferred there remained the amount of $15,053 to apply on the common, or equal to about 1½ per cent. against 10.7 in 1919, some 40 per cent. in 1918 and 54 in 1917.

Among the changes in the executive of the enterprise is noted the return of W. M. Weir, as president, succeeding T. J. Dillon, whose resignation was announced a short time ago. Mr. Weir retired from the position of president last year, but remained on the board. The board now stands as follows: Wm. M. Weir, president; Hon. George P. Graham, vice-president; Hon. W. J. Shaughnessy, Montreal; Lt.-Col. C. M. Monserrat, Ottawa; W. T. Sampson, Gananoque; Lt Col. C. W. McLean, W. D. Robb and B. F. Conway, Montreal; James Arnold, general manager, Brockville; and J. H. Briggs, Brockville, the latter being also secretary-treasurer.



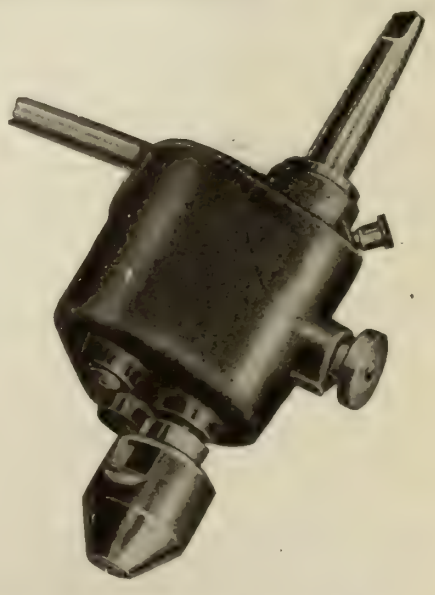
# Aikenhead's

A Manufacturer, in offering his products, must choose a worthy representative—else his products lose prestige.

Aikenhead's is Canadian Headquarters of many of the world's largest manufacturers of fine tools.

Two well-known samples are shown below.

## Van Dorn ELECTRIC TOOLS



Van Dorn Electric Drills make neat, clean holes 50 per cent. faster than the best pneumatic drills.

For 15 years Van Dorn Electric Drills have been the recognized standard by which all portable electric drills are judged. They are both fool and trouble proof. Such quality insures continuous service on your work.

**Buy them at Aikenhead's.**

## WAHLSTROM'S Tapping Attachment

Why stick to the old slow and expensive practice of Hand Tapping when you can do the same work in one-tenth the time with a Wahlstrom Automatic Tapping Attachment? It imitates the simple to-and-fro motion of hand-tapping and will tap holes as squarely as they could be drilled. For tapping in soft materials the oscillating motion can be changed to a continuous revolution.

Made in two sizes. No. 1 takes taps of all sizes from 5.40 to 1-2 inch standard. No. 2 takes taps from 1-4 inch to 3-4 inch. **Buy them at Aikenhead's.**

## Aikenhead Hardware, Limited

**17 Temperance Street, Toronto, Ont.**

# FEAR MERGER MAY INTERFERE WITH DEVELOPMENT IN PICTOU

THE resignation of Felix Notebaert as general manager of the Acadia Coal Co., Ltd., has called for some criticism in the east, and there are those who see in it a letting up of certain developments that are much desired, especially in Pictou County.

In a recent issue the Evening News of New Glasgow said:

"* * * * The proposed British Empire Steel merger was never particularly popular in Pictou County. The general feeling was that Nova Scotia could work out its own salvation and that it could best do so by big developments in its native county.

"In a word, the public believed that with Mr. D. H. McDougall at the helm the future of Trenton and New Glasgow was assured, that with Mr. Notebaert as his lieutenant at the collieries the future of Stellarton, Westville and Thorburn was also assured, and that what has been done heretofore was only an earnest of what the future had in store for us.

"That Mr. D. H. McDougall will grapple with the situation and straighten matters out is generally hoped. The public have confidence alike in his ability and in his sagacity. He has handled other situations just as trying and come out on top. What the people of Pictou County now want and expectantly look to him for is (1) no entangling alliance which would imply that the identity of Scotia would be lost, (2) a policy of expansion at Trenton, and (3) continued and accelerated expansion of the Acadia collieries with Mr. Notebaert as general manager for many years to come.

"Mr. Notebaert, we may say in conclusion, may have an idea that the people of Pictou County would rather have a "native son" or a man of English descent in charge of the Acadia collieries. There was a time when that feeling did exist, there was a time when we thought so and said so, but by sheer force of his personality, by his splendid record, particularly as a mining expert, and by his fair treatment of his employees, Mr. Notebaert has not only worn down adverse sentiment, but he has also won a place in public esteem so marked that the consensus of opinion is that he cannot be replaced, and that he must not be allowed to go if there is any way under Heaven of preventing it."

---

**Start to Work.**—A number of the employees of the Hercules Rubber Co., Ltd., Brampton, Ont., commenced work on Monday. Mr. Fairty, the manager, is hopeful that the full staff will be taken on in the course of a couple of weeks. Orders for spring delivery continue to come in and prospects for the coming season are bright.

### BROKEN HILL PLANT CLOSED

A cablegram from Melbourne, Australia, reports that the New Castle Steel Works of the Broken Hill Proprietar, Co., Ltd., has been closed on account of the strikes at the mines of the company. The New Castle Steel Works employs about 5,000 men. During the year ending May 31, 1920, the company produced 296,000 tons of pig iron from two furnaces with a combined capacity of 1,000 tons daily. An additional furnace of 500 tons daily capacity has since been added and preparations are under way for the installation of a fourth blast furnace.

---

# MR. J. N. TALLMAN DIES IN HAMILTON

**President of the Tallman Brass and Metal Co., and Was in Business For Quarter Century**

Joseph Nelson Tallman, well-known brass manufacturer and president of the Tallman Brass and Metal, Ltd., Hamilton, died at St. Joseph's Hospital. Mr. Tallman had been ailing for some time past but the news of his death will come as a shock to a wide circle of friends. He was born in Hamilton on North John street 73 years ago and had been a resident here practically all his life. He was a member of the First Methodist Church and held the office of trustee and member of the quarterly board of the church for a number of years. He was one of the oldest members of the A.O.F. and Chosen Friends, but during the last few years did not take an active part in these organizations. In 1896 Mr. Tallman purchased the brass business on North Wellington street from William Hunter and since that time has enlarged the plant, which is now situated at the corner of Sanford avenue and Wilson street.

In business circles deceased was well known and he took a very active and prominent part in the management of his firm until his last illness. He is survived by his widow, two sons, William and A. H., of Hamilton; three daughters, Mrs. W. B. Anstey and Mrs. R. Hill, of Hamilton; and Miss Alma, at home; one brother, Walter H., of Penetang, and three sisters, Mrs. L. Bowron, of Hamilton, Mrs. C. Duff, of Ancaster, and Mrs. D. Woon, of Toronto.

---

### POURING 50 TONS

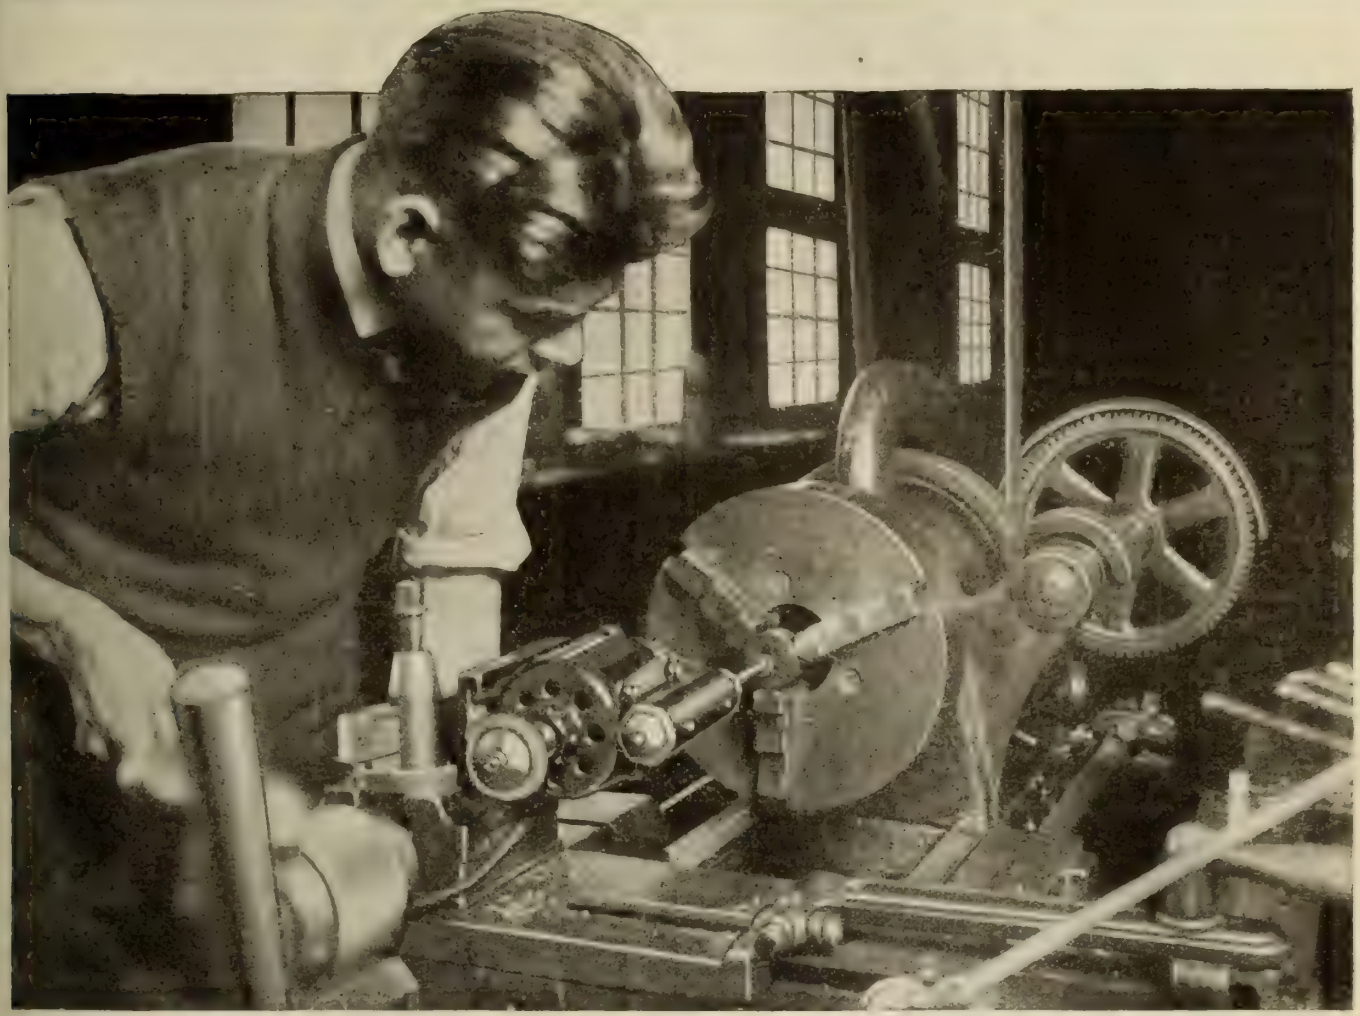
Continued from page 87

be let loose, some of the brickwork taken out. That fifty-ton mass was going to cool off, and it had to have a chance to contract evenly—otherwise, in plain talk, something might bust. And so little by little things will be stripped and taken away until that hundred thousand-pound chunk is ready to be heaved out of its pit and travel off with the rest of the trinkets that go with it to make up the world's largest dynamo. Some of these trinkets have been finished. One of them was sitting on a flat car, but how that car was going to get out of the door was more than I could tell, unless they took a bite out of the wall.

But the iron men talk in tons up at that shop just now. This piece is forty tons, that one seventeen, another a mere trifle like thirty or so. Finished, it will be around 300 tons.

It's a real man's job turning out such work as is being done at the Allis-Chalmers shop just now.

# CALLS IT BUSINESS IMMORALITY



By CHARLES PIEZ, President Link-Belt Co., Chicago

ONE of the discouraging, if not alarming, symptons attending the present business depression is the attitude of the merchants, dealers and jobbers on the subject of cancelling orders. While a sudden and severe reduction in demand may warrant a distributor in holding up or cancelling an order, there is absolutely no justification for the position taken by many distributors that they can cancel or reduce orders without incurring any obligation.

If manufacturers are going to permit distributors to escape responsibility for losses involved in cancellations, then they will encourage overpurchases in the future, with the loss and derangement to business which such overpurchases and consequent cancellations involve.

It is only when a merchant, dealer or jobber realizes the responsibility he is under when he places an order, that he will investigate conditions before he buys, and base his order on an intelligent estimate of the demand.

The widespread feeling that orders can be cancelled with impunity must be cured by a more vigorous and definite insistence on accountability for losses involved; for it is essential to the continued soundness of our business structure that this piece of business immorality be permanently stamped out.

# Grinding Diameters on Ring Gages to Close Limits

In the Terry Turbine Company of Hartford, Conn., Dumore Grinders are used on jobs where accuracy is of the utmost importance.

The job shown here is a special Gage—diameter .750-in. with plus or minus limits of .0002 in. Because the Dumore grinds to extremely close limits it is just the tool for work of this character. Besides, the ease with which it can be set up for service wherever necessary gives it an advantage over other methods of handling many kinds of work.

Dumore Grinders can be used anywhere, taking their power from the nearest lamp socket; extremely simple and durable, they offer an economical method for accurately finishing work without changing the setting.

See the Dumore at work. Ask a man who uses one. Or have your dealer give you a demonstration.

## B. C. PAYS BOUNTY FOR PIG IRON NOW

**On Finished Iron From B. C. One Company Will Get $3 Per Ton**

Victoria.—To encourage the establishment of the iron and steel industry in British Columbia, the Provincial Government has entered into an agreement with the Coast Range Steel, Limited, whereby the Government promises to pay bounties not exceeding $3 per long ton on pig iron manufactured from ore mined in the province. The agreement sets forth that British capitalists are prepared to invest the necessary capital, "not exceeding £10,000,000," in the establishment of the industry. Engineers are now investigating the resources to ascertain if conditions are suitable for the establishment of the industry.

## NEW PRICES NAMED BY READING CO.

Reading, Pa.—At the annual election of officers and directors of the Reading Iron Company, one of the largest independents in the East, prices were substantially cut, effective March 1. The company operates nine plants here, at Columbia, Pottstown, Birdsboro' and Danville.

The company announced a reduction of from $8 to $10 a ton in the selling price of tubular products. The price of cut nails and bar iron was reduced several weeks ago. These reductions are made with the hope that they will bring in orders sufficient to run the plants at a better rate of production. Orders received during the last two months were the lowest in the history of the company, and unless orders are received the outlook is not bright.

## GOING AHEAD TO LOCATE COAL

Reports of provincial analysts and other kinds of geologists have not cooled the ardor of those who believe there is coal around Shelburne, Dufferin County.

A while ago investigations were made, and as a result a very discouraging report was made to the effect that the chances of finding coal in such surroundings were nothing at all.

The sequel comes in this announcement in the Official Gazette:

Two million dollars is the authorized capital of the Chamberlain Coal and Oil Development Co., Ltd., which has been granted letters patent and will have its head office in the village of Shelburne.

The new company under its charter is authorized (a) To acquire, own, lease, prospect for, open, explore, develop, work, improve, maintain and manage mines and mineral lands and deposits; and (b) to take, acquire and hold as consideration for ores, metals or minerals, including oil and gas, sold or otherwise disposed of, shares, debentures or other securities and to sell and otherwise dispose of the same; with a capital of two million dollars, divided into two million shares of one dollar each; its head office at the village of Shelburne, in the county of Dufferin.

## ENGINEERING

**New Company.**—The Canadian Toledo Scales Co., Ltd., has been incorporated with head office at Windsor and capital stock of $350,000 to carry on the business heretofore carried on in Canada by the Toledo Scale Co. of Toledo, Ohio, and to carry on the business of mechanical engineers and dealers in and manufacturers and operators of plants, engines and other machinery, including scales and weighing and testing machines of all kinds.

**Want Guarantee.**—The National Shipbuilding Company, of Goderich, which was organized in 1917 to build trawlers to the order of the British Admiralty for use in the North Sea, are asking the town council of Goderich to guarantee a bond issue that has been created on the property and assets of the company. The organization is perfecting and manufacturing a flax-pulling machine of the Vessot model, on which the patent rights are held both in Canada and abroad. Marine engines and boilers were made for the Imperial Munitions Board, t French government and the Unit States Emergency Fleet Corporatic Before the shipbuilding industry beg to subside, the National Shipbuilding C turned its attention to the manufactu of the flax-pulling machine. In aski the municipality to guarantee the bo issue, the company points to its reco including wage payments aggregati $400,000 for three years and nine mont ending December, 1920.

A large British factory, which w erected during the war chiefly for t production of "dope" or varnish for aer plane purposes, is turning its attentic to the application of these and oth products as peace time products. It h been found that this aeroplane dop makes an excellent insulating varni for electrical machinery. Further, pap strips drawn through the solution b come impregnated with it and are the suitable for winding on copper wires t make "paper-insulated" cables for tel phone and electric power purposes. A tificial silk, which can be braided on t wires instead of the natural silk, is als produced; and still another possible lir of development is in the molding of ele trical connections in celluloid, which ha a very high electrical resistance and non-flammable even when exposed t the heat of a fierce flame. All thes products are "synthetic"; that is to sa they are built up by chemical processe from simple constituents.

## TRADE GOSSIP

A sheet metal shop will be built by E. Batisti, 140 McEwan Ave., Windsor, Ont.

The Board of Control is contemplating the erection of a garage on Lombard St., Toronto.

The Transparent Rubber Co., on Danforth Ave., Toronto, will rebuild their factory which was recently destroyed by fire.

A new industry has opened a factory at Selkirk, Man., and is known as the Canadian Insulation Company. The head office is in Winnipeg.

Ellis-McIntyre Motors Ltd., Hamilton, Ont., has been incorporated with a capital stock of $150,000 to manufacture automobiles, trucks, tractors, etc.

The Monarch Industries, Ltd., Beamsville, Ont., has been incorporated with capital stock of $300,000, to manufacture registers, carburetors, motors, etc.

Plans are being prepared by Downing and Kayll, architects, 525 Seymour St., Vancouver, for the erection of a hotel to cost $1,500,000 for an Eastern syndicate.

J. M. Schneider & Son, 63 Courtland Ave. E., Kitchener, Ont., are building a garage costing $10,000. W. H. E. Schmalz, architect, Frederick Street, is preparing the plans.

A new firm, known as the Drifting Sand Filters, Ltd., has been recently incorporated with head office at Toronto. Filters such as those installed at Toronto Island will be manufactured. Mr. E. L. Cousins, manager of the Toronto Harbor Commission, is the president.

It has been stated that tenders will be called shortly for alterations and addition to building at an estimated cost of $40,000 for L. R. Steel Co., Ltd., Royal Bank Building, Toronto. The architects are Gardiner and Mercer, 718 Granville St., Vancouver.

Plans are being prepared and bids will be called in the near future for airplane hangars and a machine shop to cost $75,000 for the Dominion Government Militia Department, Ottawa, Ont., to be erected at Vancouver, B. C. Major McLaurin, Hotel Vancouver, Vancouver, B.C., is superintendent of Jericho Station.

The Westinghouse Electric and Mfg. Co., East Pittsburg, has announced a wage adjustment, effective March 1, which cuts the present pay of workmen approximately 15 per cent. The announcement, made by H. P. Davis, vice-president in charge of operations, states that the cut is due to competitive market conditions, the decline in prices and the decrease in volume of business.

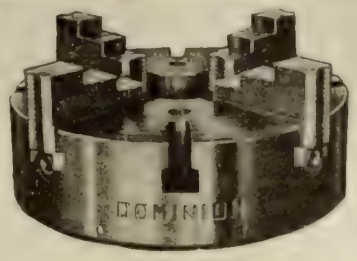
---

The death occurred on February 26 of G. R. Baker, 615 Huron St., Toronto, who for many years had been a member of the engineering firm of Westman and Baker. He was an active member of the Lakes Association of Muskoka, and commodore of the Toronto Canoe Club.

## PERSONAL

Joseph Pearce, Brockville, Ont., has retired after forty-eight years of service as locomotive engineer on the Grand Trunk Railway. His period of service dates from the time of wood burners which he fired on the old Brockville and Ottawa Railway. Since 1875 he has been with the G. T. R. in freight service between Brockville and Montreal.

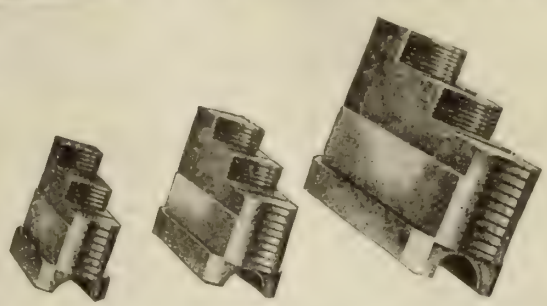
A Welland despatch says: It is announced that T. J. Dillon has resigned from his position as president, general manager and director of Canada Foundries & Forgings, Limited, with plants at Brockville and Welland, which over a period of years under his management has been built up into one of the strongest Canadian manufacturing institutions, with an enviable reputation and records for earnings. Mr. Dillon is well known amongst the manufacturers in this country as one of the leading steel men. He will interest himself vigorously in manufacturing different lines of steel products in Welland and the Niagara district. "I am going to operate right around Welland," said Mr. Dillon, "and help to make this a bigger and better city to live in."



## MACHINE SHOP PRACTICE

A rather interesting book, entitled "Elementary Machine Shop Practice," has been issued by the D. Van Nostrand Co., 8 Warren St., New York. This is really a text book presenting the elements of the machinist's trade, and the author, James A. Pratt, who is a mechanical engineer, is also director of the Williamson School of Mechanical Trades. The price of the book is $2.50 and it is well illustrated throughout, in fact there are over 200 illustrations.

Briefly, here are the contents in chapters: Bench and Bench Work; Supplies and Miscellaneous Tools; Hardening and Tempering; Machine Adjustments; General Tools; Lathe Tools; Lathe Backrest, Follow Rest, Compound Rest, and Eccentric Turning on Lathe.



Drill press, shaper, slotter, grinder, and miller work; also problems in gearing. Planer work, machine shop calculations and machine glossary, including tables, etc., etc.

At the end of each chapter is a number of questions which the reader should be able to answer for his own peace of mind, if he has been intelligently reading the contents. This is a good idea, for it has the tendency of making the reader be careful in his perusal. There are many existent who believe a short reading of a technical book should make them more efficient immediately. This is not so, for to get the most out of any book, especially a technical book, you must not only read, but study the contents. Taken in all, this book should interest the budding mechanic who is anxious to get on.

DOMINION CHUCKS

STEEL OR CAST-IRON BODY
BUILT FOR HEAVY DUTY

The Jaws Are Extra Strong

THEY are drop forgings, made of best quality steel, heat-treated and hardened. The threaded portion of jaws form a half nut for the setting-up screws. Have stood the test of heavy duty work in our own shops where accuracy was the only accepted standard.

CANADIAN MACHINERY wants a representative in every town and city where there is a metal working plant or large machine shop.

We require first of all the ability to demonstrate to mechanics the value of reading technical journals in general and CANADIAN MACHINERY in particular, and to secure their subscriptions.

Second—we want men who can tell news when they see it. Not necessarily men who can write, but men who are alert for news, and who will give us the facts, briefly and plainly.

We will pay you liberally if you can handle this work for us in your city.

# That Single Heater, With No Outside Pipes or Ducts, Keeps Our Whole Factory Warm"

"We've got all that open space out there—had all sorts of trouble keeping it warm. Naturally, I was a little bit skeptical until the Skinner Bros. salesman told me he would put in his heater on an absolute guarantee to keep all of the factory warm, all of the time—that if it failed we could return it and get back every dollar we paid. I told him to put it in. That was five years ago—since then we haven't had a bit of trouble—temperature is always right around 70 and we hardly ever run the heater more than three or four hours a day."

### Simple in Principle

The Skinner Bros. (Baetz Patent) Heater is an individual enclosed unit, with a series of steam coils compactly mounted above a powerful fan wheel. Cold air near the floor level, or from outside, is drawn into the heater by the fan, forced up and around the coils, and, after being heated, is gently distributed through the outlet hoods into the open building space. Uses live or exhaust steam—where steam is not available, we supply our direct-fired type, which burns coal, coke or wood.

The heater is portable—requires no special foundation—installation cost is 15% to 50% lower than any other type—operating cost is equally low.

Find out more about this heater. If you wish, we will send you names of users so you can make your own investigations.

### MECHANICAL DETAILS

**Built as an individual enclosed unit with a series of pipe coils compactly mounted above a fan wheel, and heated by exhaust or live steam. Cold air near the floor level is drawn into the heater by the fan, impelled upward and around the coils, and, after being heated, distributed through outlet hoods to every part of the open building space.**

**Large illustration at top shows direct fired type D-F, fired with coal, coke or wood.**

# MALLEABLE AND CAST IRON PIPE FITTINGS

Quality Products

Annual Capacity
6000 Tons

Prompt Service

Brand Pipe Fittings, Screwed or Flanged, Black or Galvanized.

We are equipped to make the general run of malleable and grey iron castings for machinery manufacturers, agricultural implements, automobiles and specialties.

**Cast Iron Fittings**

stamped with our trade-mark mean fittings made with iron of high tensile strength — proper proportions and correct tappings.

**RECESSED DRAINAGE FITTINGS**

**Malleable Fittings**

of our brand mean fittings made of *Air Furnace Refined Iron,* reamed and tapped to gauge with perfect threads.

A trial of our pipe fittings will prove the quality of service they give.

**International Malleable Iron Company, Limited**
GUELPH, CANADA

*Representatives:*
Halifax—GEO. D. HATFIELD, Bedford Chambers
St. John, N.B.—H. G. ROGERS, 147 Prince William St.
Winnipeg—HARRY F. MOULDEN, Confederation Life Building
Vancouver, B.C.—CYRIL AMES, Wilton Block
Montreal and Toronto—From Head Office, Guelph, Ont.

# Sweeney and Reginald

SWEENEY the quick-footed, quick-thinking, rugged iron worker and Reginald the pride of the parlor are off—where's your money?

And yet you employ "Reginalds" to do your high speed reaming—pretty pedigreed reamers, expensive and brittle as a match—when high speed reamers with all the burly strength and speed of *"Sweeney"* are yours for the asking.

The ordinary high speed reamer *must* be both brittle and expensive, for the big, bulky body is the very *last* place that brittle high speed steel should be used in a reamer.

## PEERLESS ~~HIGH SPEED~~ REAMERS

Peerless High Speed Reamers are the "Sweeney's" of reamerdom—tough, gluttons for punishment, yet high speed from tip to toe. Peerless bodies are of a special tough alloy chosen especially to withstand shocks and tortional strains.

Peerless blades, however, are of high speed stock selected and treated to develop every ounce of the cutting capacity peculiar to high speed steel. Blades and body are then eternally united by a patented proeess called "Brazo-Hardening."

The result is a burly, a rugged high speed reamer that can fight through a 20 round "go" and be ready for more—the sort of high speed reamer that is ready to tackle any job in your shop requiring speed and punch and endurance— the sort of job that *stumps* the ordinary high speed reamer is the sort of job "Peerless" is used to—

*We Invite You to Try to Stump "Peerless"*
*With the Toughest Job in Your Shop.*

Do Your Castings Cost Too Much?

A rearrangement of your patterns might cut their cost 25 per cent.; a different method of molding them might double your production at no increase in molding cost. We can advise you and we have expert metal and wood patternmakers who are able to make any changes that may commend themselves to you.

If you need some new Patterns

send us a sample, blueprint or sketch, and ask for our advice. It won't cost you anything. If our advice is good and commends itself to you, it is only fair to assume that our work will be equally satisfactory, and we need the work as badly as you need the patterns.

We are in a position to do turning, boring, drilling or other semi-finishing operations on castings supplied by us. Ask us.

*We have for our and your requirements, a large stock of assorted White Iron Stars, suitable for light agricultural to medium weight machinery castings, while they last, at 8 cents per lb. F. O. B. Galt.*

**Special Analyses**

WHEN you purchase or specify our Alloy Steels for your product, you get with the steel the assurance that a competent metallurgist is at your service in the working and treatment of that steel.

Our standard analyses embrace all types of Commercial Alloy Steels—open hearth and electric furnace grades, and our specialization in the manufacture of Alloy Steels enables us to assist our customers in the selection of the correct steel for their requirements.

We melt—roll—cold draw—heat treat our steels in one large plant and under expert supervision.

***Avail yourself of our consultatory service:***

If you have any place in your manufacture where you think you could use an Alloy Steel to advantage, give our engineers the opportunity of assisting you in the selection of the proper grade and type.

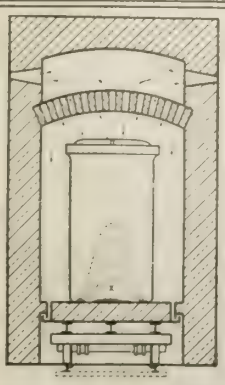
## Have You Business Information on File?



Our service brings to your desk interesting news collected from the newspapers, relating to your business.

Often you plan your affairs on market conditions and new developments, but you could plan much better with full information before you from the whole of Canada and United States.

These newspaper clippings have proven most valuable to business houses, saving time in searching files and often being turned to good account getting orders and contracts through these leads. As an aggressive firm you would be kept in constant touch with all activities affecting your line of business. You can use this business data on industrial conditions, crop reports, factory expansions, fire losses, insurance news and trade changes. Consult our service man—he can suggest a service that will save you time and solve your problems.

**Canadian Press Clipping Service, 143-153 University Ave., Toronto**

Irregular heating of high charge in car furnace, showing tendency to overheat at the top and information of cold zone (X) at bottom, due to comparatively cold hearth.

## Uses and Limitations OF Car Type and Car-and-Ball Type Furnaces

**are clearly defined in Bulletin 222-T**

W. S. ROCKWELL CO. INDUSTRIAL ESTABLISHED 1888 FURNACES NEW YORK

Typical installations are shown to illustrate—

The applicability of car type and car-and-ball type furnaces to the heat-treatment of material that cannot be advantageously handled in other types of furnces.

Factors governing selection of the type (car or car-and-ball) best suited to individual manufacturing requirements.

Difference in design of each type.

Influence of unequal cooling on the quality of finished product.

In brief, this bulletin is a discussion of principles which will appeal to those interested in furnace design, loading and handling methods, heat generation and utilization, etc.

***Write for Bulletin 222-T to Canadian Representative.***

# A Stirring Instalment of Heming's Famous Story

ARTHUR HEMING continues his remarkable story of Canada's Northland in March 1 MACLEAN'S MAGAZINE. In "Wild Animals and Men" he tells how he and Oo-Koo-hoo tracked and trapped wolverine, lynx, and other wild animals, and tells fascinating stories of battles of wits between the hunters and the hunted. The wiles of the Indians and half-breeds are pitted against the amazing, almost superhuman craftiness of the animals—and sometimes the denizens of the forest wilds outwit their human antagonists.

## Fun at Opening of Parliament

J. K. Munro sat in his seat in the Press Gallery, Monday, February 14, when Parliament opened, and looked down with the good-natured tolerance and contempt of an iconoclast and a satirist at the proceedings. The members invariably amuse "J. K."; it takes a really big man to elicit more than scant praise from his sophisticated pen. His March 1 article is entitled: "Funny, as the Owl is Funny."

## Other Big Features and Fiction

**"Canada's Fur Future,"** by Agnes C. Laut. Telling what a potential gold mine Canada has in her fur industry, properly conserved and exploited.

**"Goldwin Smith,"** by James Mavor, Ph.D. The personal side of the "Sage of the Grange," the man who was tutor to King Edward VII, before coming to Canada.

**"More Political Memoirs,"** by Col. George H. Ham. Further stories of the "Solons of the Eighties," and Ottawa 30 or 40 years ago.

**"Pawned,"** by Frank L. Packard. The story of a triple regeneration—in this instalment John Bruce declares his love for the "Pawnshop Girl."

**"The Man Who Knew Too Much: The Bottomless Well,"** by Gilbert K. Chesterton. This Near-Eastern well and a revolving bookcase figure in a baffling murder story, handled by England's master of fiction.

**"The Lady at His Door,"** by Barker Shelton. A girl takes a law course, graduates—but that doesn't mean clients. But she gets a partner—and for life.

**"The Millionth Chance,"** by Henry Holt. An Adventurous sea story, with a girl skipper and a man who won her respect—and even her love.

## Review of Reviews

**Split Among the Socialists—** Joseph Gollomb

# MACLEAN'S

"CANADA'S NATIONAL MAGAZINE"

*Name of Hardware Merchant and further details, supplied upon request*

# The Answer is—He Didn't!

THE crowd was drawn by a hardware firm in an Ontario town of 700 population. This crowd of over 1,000 people represents customers of the store, drawn from miles around, to attend the picnic given by this firm to its customers. Surely this is evidence of the close relationship between this hardware firm and its customers.

The close relationship between retailer and customer in this instance is typical of conditions existing in hundreds of Canadian towns, villages and cities.

The average hardware merchant (particularly in the smaller cities and towns) has been established for many years. He has a big business connection built up through years of efficient service to his customers. He is well rated, and a desirable man with whom to do business. He influences the buying habits of the people in his community, and in over 90% of the sales made, he is the deciding factor.

*"Which one do you recommend?"* is a question asked thousands of times each day in the hardware stores of Canada.

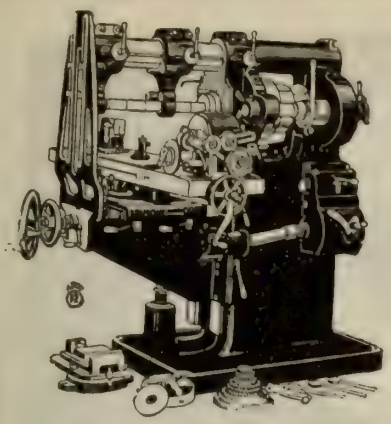
If you can get the effort and enthusiasm of the retail hardware merchants and their clerks, plus their window and interior displays and local advertising behind your goods, you will have secured the co-operation of one of the greatest available selling forces.

**HARDWARE AND METAL is paid for, and read, by all the wholesale hardware buyers of Canada, and over 90% of the retailers from coast to coast. They are the men who control the sale of your products to the hardware consumers. HARDWARE AND METAL can put your story before, practically, the entire Canadian hardware trade. One of our representatives would be glad to give further details.**

**(Only hardware paper in Canada with membership in the Audit Bureau of Circulations).**

## HARDWARE & METAL

*Canada's National Hardware Weekly since 1888*



**143-153 University Avenue - - Toronto, Canada**

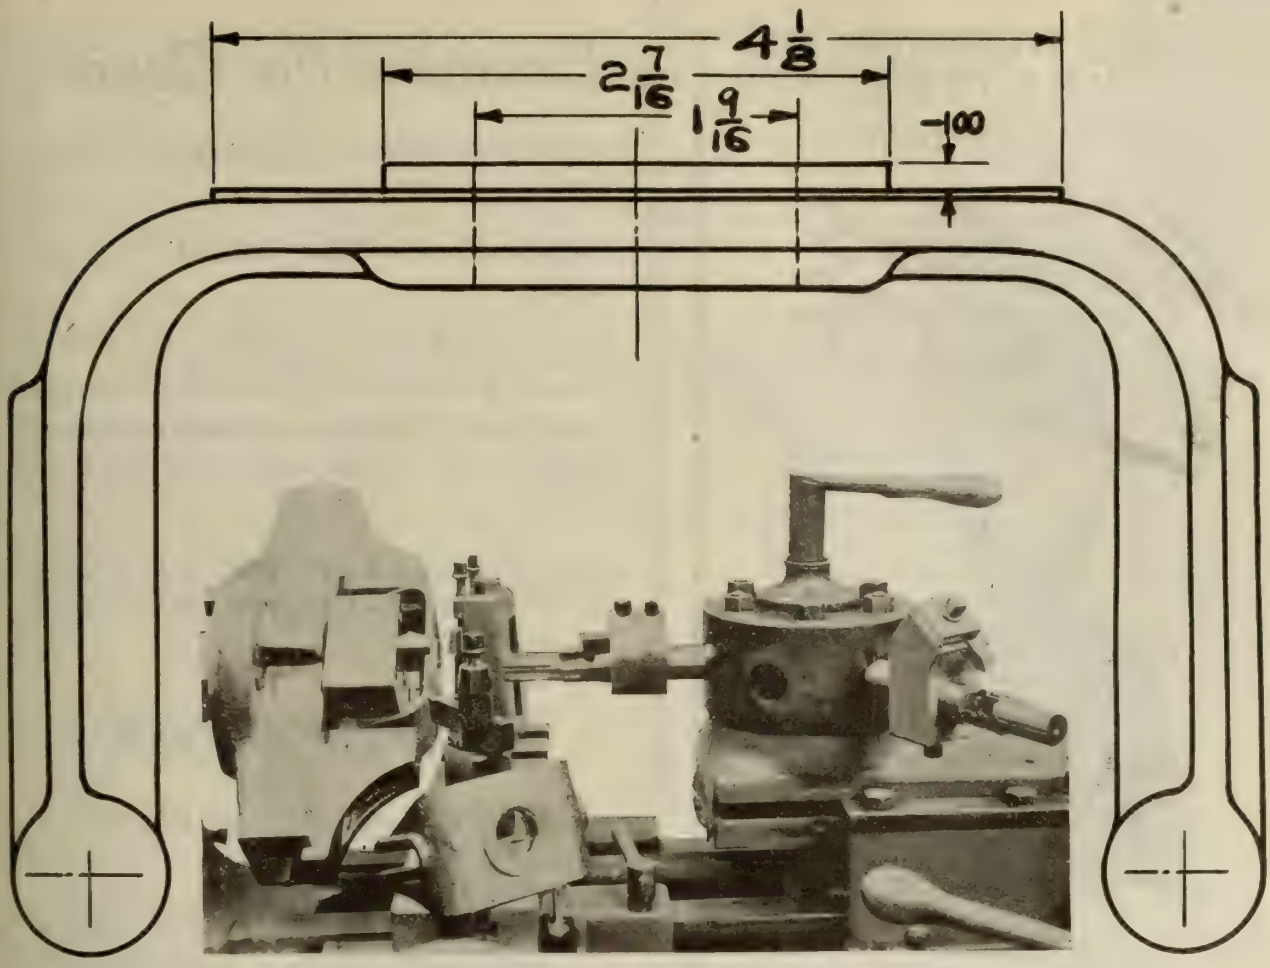
## Alowalt Grinding Wheels

### *Best to Break Through the Case on These Forgings*

The parts are case hardened forgings for 6″ differential gear cross arms. These are mounted on an arbor and set up as for cylinder grinding (see photograph), a method of handling the work that makes severe demands on the wheel. Arms are ¾″ in diameter and about 1-16″ of stock is removed.

After many tests a Waltham No. 346L. Special Alowalt Grinding Wheel 18″ diameter, 2″ face, was selected for this job and is now used exclusively. Production averages 90 per hour.



There's a Waltham for every job, no matter how tough or how delicate. Put your grinding problem up to us. We're here to help.

*Examine the Grain!*

A properly alloyed babbitt has a perfectly uniform grain.

Break a bar of the babbitt you are using—

If you find the grain irregular—if it shows a mixture of fine and coarse particles—if it shows a separation of layers—one dark and one light in color—

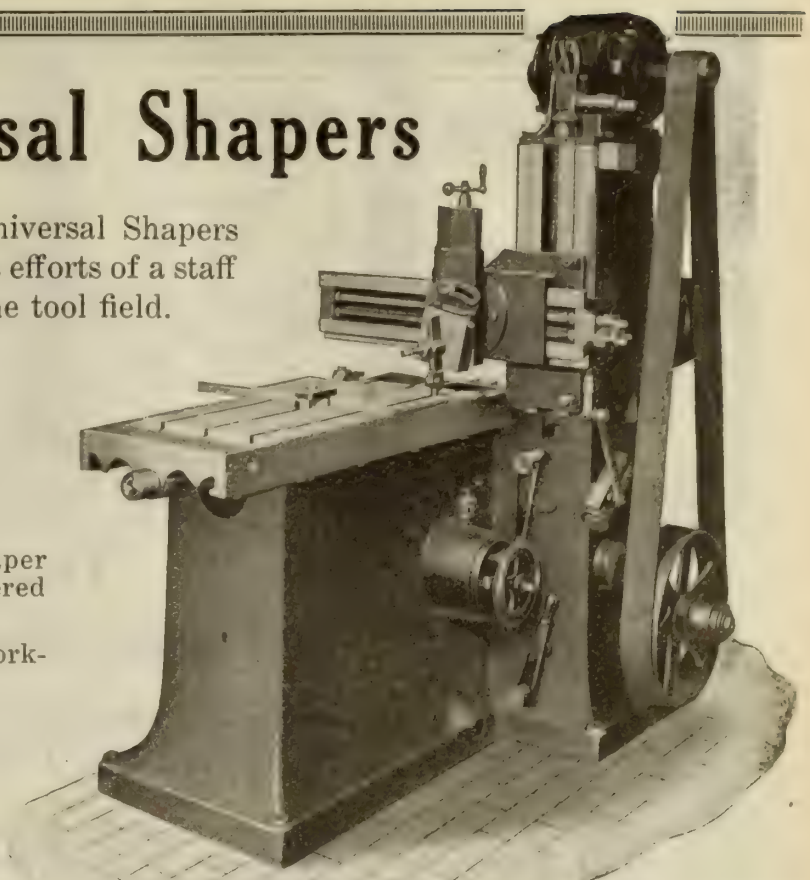
then you may know that it is poorly alloyed—and that you can get far better wear from

*Lionroyal*

produced by the STANLEY PROCESS of alloying.

Lionroyal is clean—uniform—dense grained—and durable.

It is copper-hardened and tin-toughened. Bearings lined with it carry the load evenly—every inch of bearing surface equally durable.



It has no hard spots of copper or antimony, because the hard elements are thoroughly and uniformly amalgamated with the tough elements. This fact bespeaks steady service and long wear.

***Write for booklet "AB" to know more about pouring and using Babbitt.***

"W & B" Screw Wrenches are dependable *tools* for the heaviest duty because into each of their *parts* is put the skill and experience—the "know how"—gained during nearly half a century of wrench manufacture.

They contain no weak member. With head and bar drop-forged in one piece from specially selected steel, extra heavy jaw thoroughly case-hardened and an accurately made solid steel screw, each part contributes its individual share toward the assured, dependable strength of the completed tool.

Two models—"Railroad Special," with iron handle, and Machinists' Knife Handle, illustrated above, are the strongest and best heavy duty screw wrenches made. Seven sizes—6 to 21 inches.

A third model—"Agricultural"—is supplied at a lower price where the maximum of strength and service is not necessary. Five sizes—6 to 15 inches.

# Leak Insurance

The Welded Tank answers ideally the demand of the industrial engineer for tanks which must be tight, strong and permanently leak-proof.

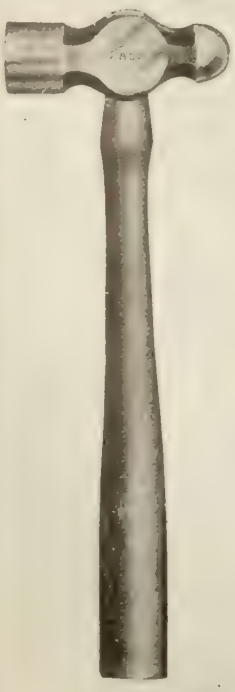
The oxy-acetylene process has made such tanks possible and

Prest-O-Lite

DISSOLVED ACETYLENE

because of its high quality and extreme portability has increased the usefulness of the welding and cutting torches a thousand fold.

Especially is this true wherever large, cumbersome sections are to be welded —Prest-O-Lite can readily be carried anywhere—it goes to the job.



Tank makers are assured of the highest quality of gas and a constant and unlimited supply by using Prest-O-Lite.

A chain of plants and warehouses is kept busy meeting the demand for this most useful of gases.

# The "TOLEDO" TOGGLE DRAWING Presses

Their reliable performance under all conditions — the cumulative gain in production — the great decrease in cost of both upkeep and production are some of the reasons for the progressive success of these presses. The patented toggle mechanism is notable for simplicity and effectiveness. We solicit the opportunity of placing the details of construction before you.

**THE TOLEDO MACHINE & TOOL CO.**
TOLEDO, OHIO

## "Hisco" Machine—Molded Gears

The fact that "Hisco" Machine Molded Gears require no pattern is a factor of considerable importance when the price of lumber and labor is so high. "Hisco" quality insures accurate, dependable gears. Remember — **the price of "Hisco" gears does not include the cost of patterns.**

We are also manufacturers of Steel, Chrome, Manganese and Nickel Steel Castings, Annealed and Unannealed; Cement Mill and Mining Machinery; Castings; Stamp Mills; Crushing Plants; Excavating Outfits; Steel Car Wheels; Locomotive Driving Wheels and Frames, etc.

*Let us know your requirements—we do the rest.*

**Hull Iron & Steel Foundries, Limited**

# When Production speeds up again—how about those Small Parts?

It's time to analyze your product and your buying carefully—especially those important *parts* upon which so much depends.

Let's get together. We can give you some invaluable ideas on screw machine products and assemblies. There's hardly space here to tell the whole story, but ask a brother P. A. about "Barnes-Made" Parts, Barnes Assemblies, Barnes Special Engineering Service, Barnes Quality and Barnes Deliveries.

*We're ready when you are.*

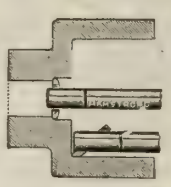
## Armstrong Boring Tools

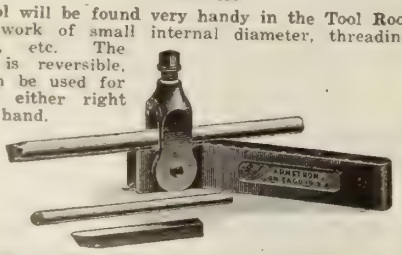


Require no forging or tempering and very little grinding. They are always ready for use, are very stiff and will bore close up to a shoulder or bottom.

1=12

One Armstrong Boring Tool will take the place of a dozen forged boring tools.

| No. | Size Shank Inches | Diam. Bar Inch | Size Cutter Inch Sq. |
|---|---|---|---|
| 00B | 5-16x 3-4 | 1-2 | 3-16 |
| 8 | 3-8 x 7-8 | 9-16 | 3-16 |
| 9 | 1-2x1 1-8 | 3-4 | 1-4 |
| 10 | 5-8x1 3-8 | 15-16 | 5-16 |
| 11 | 3-4x1 5-8 | 1 1-8 | 3-8 |
| 12 | 7-8x1 3-4 | 1 5-1 6 | 7-16 |
| 13 | 1 x2 | 1 1-2 | 1-2 |



This cut shows Double-Ended Cutter roughing out cored hole; also angle cutter boring and facing end.

## Armstrong Boring Tool Holder

**Patented**

This tool will be found very handy in the Tool Room or in boring work of small internal diameter, threading, brass turning, etc. The holder is reversible, and can be used for turning either right or left hand.

| No. | Size of Shank Inches | Size of Bars Furnished Diam. Inches | Size of Square Cutter Inches |
|---|---|---|---|
| 15 | 3-8 x 3-4 | 1-8 and 1-4 | 1-4 |
| 16 | 1-2 x 1 | 3-16 and 5-16 | 5-16 |
| 17 | 5-8 x 1 1-4 | 1-4 and 3-8 | 3-8 |
| 18 | 3-4 x 1 1-2 | 5-16 and 7-16 | 7-16 |

# TOOL GRINDING CHART

Showing clearance and rake angles for cutting tools. 17 x 27½ inches, printed in two colors on heavy manilla stock.

A splendid thing for any tool room. One large engineering firm, in acknowledging this chart, stated that they would like two additional copies as they intended adopting it as standard in their tool room.

We would like these charts placed in every shop in the Dominion and if there is not one in YOUR tool room, write for your copy at once. IT'S FREE.

# Stock Patterns in Hundreds of Sizes

—Special Designs for Special Requirements

*Manufactured under HENDERSON Patents*

## All Guaranteed for Thousands of Hours at 1800° F.—

YOU do not experiment when you use Cast Nichrome heat-treating containers, racks, furnace muffles, etc. Both special designs and stock patterns are guaranteed for a definite term of service—length of guarantee, of course, depending on operating conditions.

The large variety of stock patterns is the result of the extensive use of Cast Nichrome and takes care of most practical requirements. Bulletin N-21 shows lists of stock patterns in the different designs.

A new book, "Case Carbonizing," describes modern standardized methods as practiced in many of the foremost plants, and is free to heat-treating men and men who are responsible for heat-treating results.

Be sure to give your official title when asking for this Case Carbonizing Book.

*Cast Nichrome can be manufactured only under the Henderson Patents which are owned by the*

# Cast Nichrome

ENDURE IN HIGH TEMPERATURE

# Stop The Leaks That Steal Your Profits

There are many expensive leaks in your plant that you know nothing about. Loss of power through slippage on pulleys—spoiled materials—idle machines—employees paid for time while repairs are being made—wrong placing of belts—each one costs you money in lost production. They take more out of your profits than **our better belts** would cost.

# Dominion Friction Surface Belting

will eliminate most transmission troubles. By keeping your plant running continuously, it will save the cost of idle machines and idle employees, reduce your cost of upkeep and power bills. It stops most transmission leaks and increases your profits in the same ratio.

Our engineers are ready to demonstrate to you, without charge, that Dominion Friction Surface Belting will lower your manufacturing costs. They will make a complete analysis of your transmission equipment and put it on the nearest approach to a 100 per cent. efficiency basis.

Phone, wire, or write our nearest service branch.

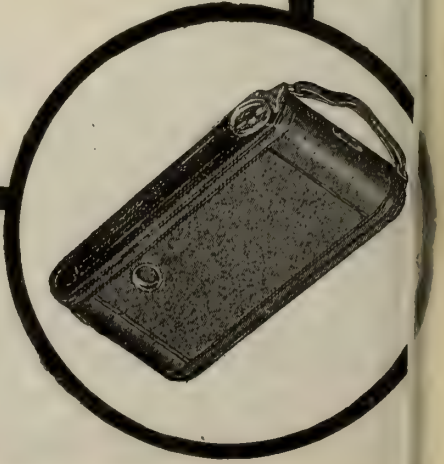
# Where Kodaks Are Created

Two 16-inch Hendey Crank Shapers and the 20-inch Shaper shown above help maintain the high quality for which all Kodak Products are noted.

The foreman's comment when spoken to regarding the precision and general utility of the Hendey, **"It's a real machine,"** describes aptly the Hendey Shaper.



Bear in mind what the many well-known users of Hendeys say of the service they are securing when in need of Shapers, Lathes or Millers.

*If interested tear out this page and place with letters to be answered.*

Two Class A-D02 120 h.p. Giant Oil Engines, direct connected to electric generators, used as standby power by the Western Union Telegraph Company, new Western Union Bldg., Chicago

# *Why Giant Oil Engines have a cross-head*

THE Giant cross-head and the efficient lubrication system which it makes possible, *double engine life.*

Giant cross-head construction conforms to high-grade steam engine design. It prevents side pressure against the cylinder walls. It obviates uneven cylinder wear, worn pistons, loss of compression and consequent hard-starting. It reduces friction to a minimum. It provides easy accessibility to all moving parts by permitting the use of readily removable frame covers. It permits compressing the charging pressure in the cylinder proper, and not in the crank case where leakage is almost unavoidable. It allows the crank end of the cylinder to be closed, thus providing for full *automatic splash lubricating system.*

The Giant system of lubrication is *positive-oiling, continuous in circulation, entirely automatic.* It saves time and saves oil.

Longer life and lower power costs invariably result from these and other Giant features that prove the worth of Giant Engines on a cost-per-year basis.

How much can Giant Oil Engines reduce *your* power bills? Engineering counsel, extended without obligation, is available to assist you in answering this important question. Giant Engines are built in single and duplex types, capacities 12 to 200 h. p. Ask for Bulletin 389.

# STAYBOLT TAPS

## The Better the Man, the More He Appreciates Them—

Not only good when new, but heat treated and seasoned to maintain this goodness. Can be ground on face of cutting edge without affecting their size. That's why you'll find Pratt and Whitney Stay Bolt Taps on the job long after cheaper, "just as good" tools are buried in the scrap pile.

Threads accurately and cleanly cut, with the least expenditure of time and effort, are other reasons why these better Taps are favorites in the shop.

If you've used them before, you know just how good they are. If you haven't, send us your first order—we know you'll be back for more. They're carried in stock in our sales rooms in all large cities.

*Chicago Pneumatic Class N-SBE Air Compressor installed in the car shops of the Boston & Albany R.R., Boston, Mass.*

# *Where dependability counts big!*

THE user of air power in moderate quantities—particularly with but one unit—needs *real* compressor dependability. In such plants an enforced shutdown means 100% air output loss.

In reality this Chicago Pneumatic Short-Belt Motor-Driven Air Compressor is a large Chicago Pneumatic "under a reducing glass."

It embodies such advanced features as: Simplate flat-disc indestructible valves, exceptionally large bearing surfaces, totally enclosed frame construction, automatic lubrication throughout, automatic regulation, insuring ideal operating economy under variable load demands.

This compact type unit is available in capacities from 69 to 1197 cubic feet per minute, for any form of drive.

Prompt delivery. Ask for Bulletin 418.

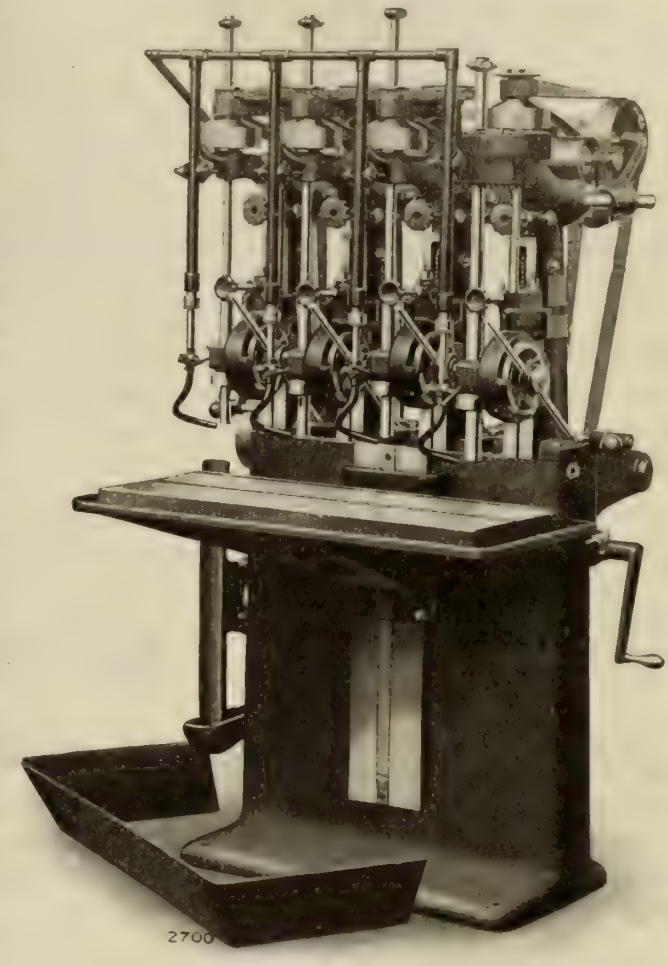
# BALL-BEARING DRILLS



THE chief direction in which the modern ball-bearing drill excels the old type of so-called sensitive drill may be briefly indicated by three words: Output, Convenience, and Durability.

To obtain the highest excellence in these three directions, every element and part of the machine has had to receive close attention both in design and in manufacture.

The design of our Ball Bearing Drills is the result of exhaustive experiments and a long experience in the manufacture of drilling machines. The patent self-acting feed is a valuable aid to increased output. The operator has only to start the drill, the feed does the rest. This relieves the operator of all tedious work in pulling the feed lever.

The materials used in the construction of these Drills are submitted to chemical and physical tests in our own laboratory to ensure a high standard being maintained.

The factory at Edgwick, where the Ball Bearing Drills are made, is equipped with the most up-to-date appliances for the production of interchangeable parts.

The extensive use of jigs and special tools, together with a rigid system of detail inspection, ensures accurate workmanship.

Machines are made with one, two, three and four spindles with hand feed plain, auto feed plain, or auto feed geared spindles in any combination.

A copy of our new booklet, Rapid Drilling, will be sent post free to anyone interested.

# What Would You Think of a Manufacturer—

—who wrote to you with a lead pencil—"We are saving much money because we do not use typewriters and telephones"? You might well wonder whether his merchandise was as much out of date as his business methods.

You know that modern time and labor saving appliances are not added expenses, but that they have superseded slower and more costly processes.

The concern which uses your business paper to tell you its business story is simply using a modern piece of selling machinery to make it easier for you to buy intelligently with the least waste of your time and theirs.

For the right kind of advertising shortens the distance between human minds just as certainly as the railroad shortens the distance between places. It is still possible to walk from New York to Chicago, and it is still possible for a business to get along without advertising, BUT—

—bear in mind that the seller who does not advertise does NOT save the cost of advertising, for it costs more to do the work of advertising by other means. Consistent advertisers are progressive merchandisers, and it pays to do business with them.

# MACHINERY AND SUPPLIES

## Opportunities in Used Tools

From time to time we have some excellent opportunities in slightly used machine tools. These tools are warranted to give satisfactory service and they can be secured at very low prices. You are urged to let us know the class of tool you need. Included in the list are: Arbor Presses, Bolt Cutters, Boring Mills, Drills, Grinders, Lathes, Milling Machines, Shapers, Planers, Punches and a variety of other machine tools. Enquiries promptly answered.

# THE JOHNSON FRICTION CLUTCH

## IF YOU BUILD MACHINERY

you are anxious to put into your product every refinement which will add to its efficiency—which will make it serve your customer longer and more satisfactorily.

One of the most important features of any machine is its clutches. No single item adds more to machine performance than a good clutch, and nothing can be a greater source of annoyance than a poor one.

Play safe and equip with Johnson Clutches.

*Write for our Yellow Catalog and Booklet "Clutches as Applied to Machine Building"*

## IF YOU USE MACHINERY

you are looking for the machine with the highest rate of production, the smallest amount of lost time, and the longest life. In all probability you will find that machine equipped with a Johnson Clutch, for the Johnson Clutch not only gives best service, but adds greatly to the convenience and speed of operation.

Look for it on the machine you buy, and to be consistent equip your plant transmission in the same way.

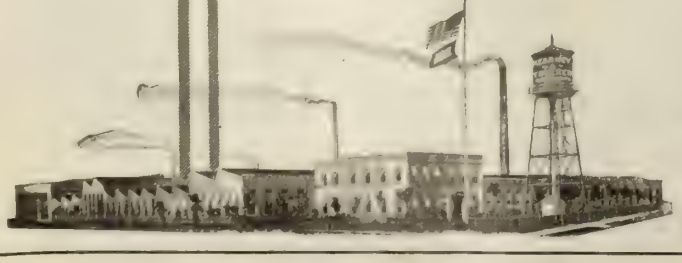
# MILWAUKEE MILLING MACHINES

A Battery of "Milwaukees" on accurate tool work in the plant of the Continental Tool Works, Detroit.

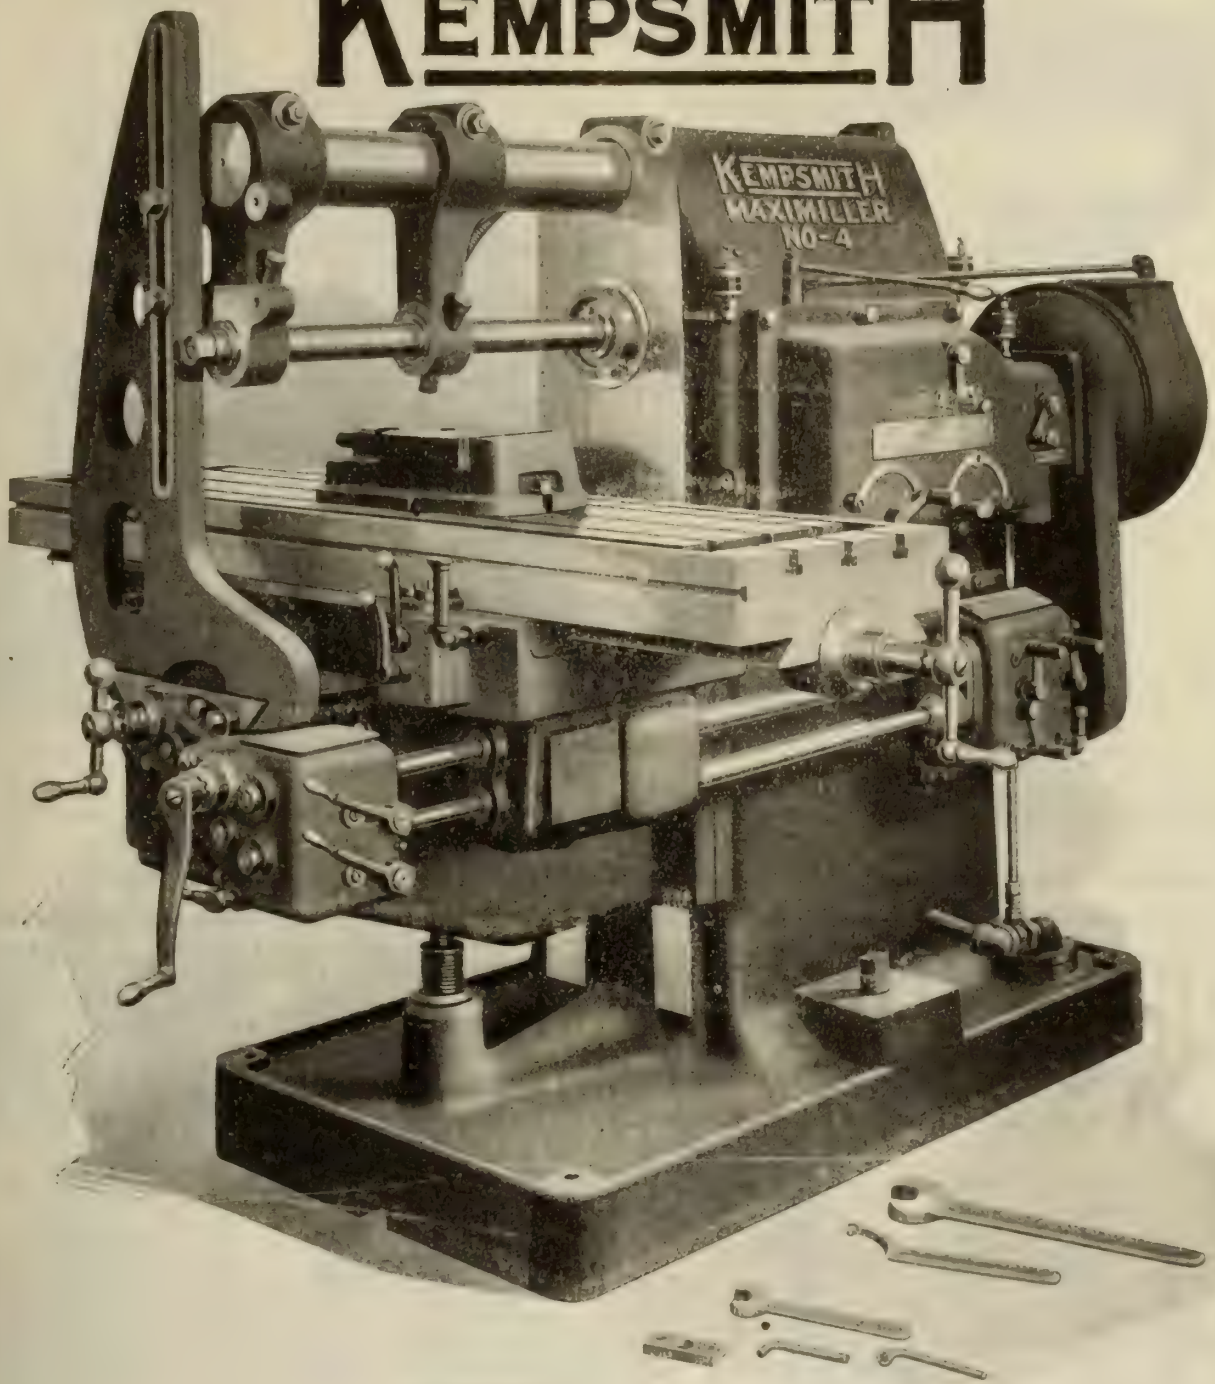


## Everywhere, In Shops That Insist On The BEST

YOU'LL find Milwaukee Milling Machines fast friends of shops that install nothing but the highest class equipment.

Positive alignment of the arbor is provided by the Double Overarm, consisting of two steel bars accurately parallel with the spindle.

The Automatic Flooded Lubrication System lubricates all bearings and gears in the column, feed box and pulley bracket. Each machine also possesses an Automatic Cutter Lubricating System which functions only when the spindle revolves or cutter lubricant may be shut off. All levers and handles are conveniently located to assist in ease of operation, making them popular with operators.



These are a few of the features representative of "Milwaukee" engineer's forethought in superior design and construction. For complete facts get our catalogue.

## "Quality" is the Big Question in Grinding Wheels

"This is the only wheel (referring to an imported grinding wheel) that ever gave satisfaction on that job, and I know it is of no use to put in yours," said the superintendent of a well-known Canadian firm. Saw work was the job in hand. Only the best quality of wheels would do, but because Dominion Wheels were Canadian-made their **quality** was questioned. Nevertheless, two Dominion Wheels were given a trial. What happened? The operator assured us that he has been using wheels over 40 years, and the Dominion Wheels put in on trial were the best that ever came into the shop.

We have solved the problem by making our own abrasives, and we are now prepared to guarantee that DOMINION WHEELS will give equal service to the best imported wheels.

**Dominion Abrasive Wheel Company,**

# For Better Chuck Service

We have manufactured chucks for thirty odd years, and during this time have naturally acquired much data and information not in the possession of chuck users generally. We felt that this information, placed for ready reference in the hands of those interested in chucks, would help them to secure the fullest measure of service from their chucks. Therefore, we have just published a conveniently sized hand-book entitled

## "CHUCKS AND THEIR USES"

Those interested will receive a copy of this book without charge. It includes:

- A history of chucks, and their development;
- A full description in every-day language of the different types of standard chucks;
- Suggestions for the proper care of chucks;
- Best methods of fitting chucks to lathes;
- Suggestions for general shop practice.

A number of these books, distributed among the mechanics in shops, should prove of value. A copy will be sent free upon request to anyone giving personal name and occupation.

*Write for your copies now. No charge.*

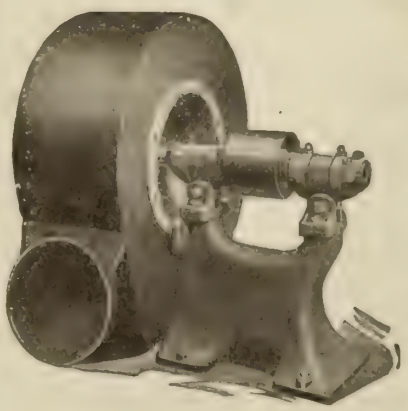
The Canadian Standard Reversible Mill Exhauster will keep your shop clean, remove sawdust, shavings, fumes, gas or any loose materials and disagreeable odors.

Insurance rates can be reduced; floors and machines covered with sawdust, chips or shavings, increase the fire risk.

Insurance companies reduce the premiums where adequate precautions have been taken to prevent fires.



Blast Wheel — This wheel is so constructed that it will handle any kind of stringy material efficiently, such as sawdust, shavings, cotton lint. Will also handle gases, fumes, smoke, etc.

The Canadian Standard Planing Mill Exhausters have reversible housings so that the outlet can be adjusted instantly to any angle desired.

This eliminates necessity of crossed belts. Simplifies changes on alterations in piping or building.

The housing is of heavy rolled steel plate securely bolted together with angle irons. Round cast iron outlet bolted to the housing. Blast wheel mounted on heavy cast iron spider.

Every fan carefully tested by running test at speeds in excess of that required.

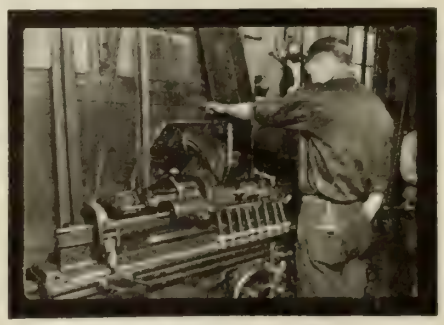
*and*
# The Gasoline Engine

*For photographs and details we are indebted to the*
BUDA COMPANY, HARVEY, ILLINOIS

**PISTON GRINDING**—The pistons come rough-turned from the lathes about .030 in. oversize, and are ground down to within a .0005 in. limit on a Norton machine, using Alundum 24 combination L wheels, 18 in. x 2½ x 5 in. The output is 300 per eight-hour day, easily handled by three machines.

**CRANKSHAFT BEARINGS**—The important operation of grinding crankshaft bearings is done with two Norton grinding machines for roughing and two for finishing; .060 in. of stock is removed from the centre bearing in roughing, and .045 in. from the front and rear bearings, leaving about .006 in. for finishing.



**CRANKSHAFT PINS**—6636-0 Alundum wheels are used in both roughing and finishing operations on crankpins, removing .090 in. of stock in roughing, leaving .010 in. to finish. The finish grinding is done to a .001 in. limit

**PUSH ROD HEADS AND SHANKS**—A Norton grinder, with an Alundum No. 24 combination wheel, 20 in. x 2 in. x 12½ in., is used efficiently for grinding push rod heads. The push rods are held in a collet, fixture turning at 200 r.p.m., and wheel speed making 1150 r.p.m. Production is about 875 per day, the finish is very high, and the surface must be exactly at right angles to the axis of rod. The push rods are electric furnace steel, bone hardened 1-16 in. deep. The shanks are rough-turned on one Norton machine, removing .030 in. of stock, and then they are sent on a chute to a second machine for finishing; .005 in. of stock is left for this purpose, the finish limit being .0005 in. and the production, 900 per day, roughed and finished. Both machines use Norton 24 combination M wheels, 20 in. x 4 in. x 12½ in.

A gasoline engine for practical, economical and efficient use is unthinkable without grinding.

Grinding Pistons; Norton Machines; Norton Wheels, Alundum 24 Combination L, 18 in. x 2½ in. x 5 in. Pistons are Gray Iron, 4½ in. x 5¾ in. .030 in. stock is removed, output 300 per day.

CANADIAN MACHINERY
AND
MANUFACTURING NEWS

VOL. XXV. No. 10 March 10, 1921

# *Milling Practice*

## Efficient Milling Means Increased Production—Varied Examples, Including Use of Attachments and Special Fixtures.

*By J. H. Moore*

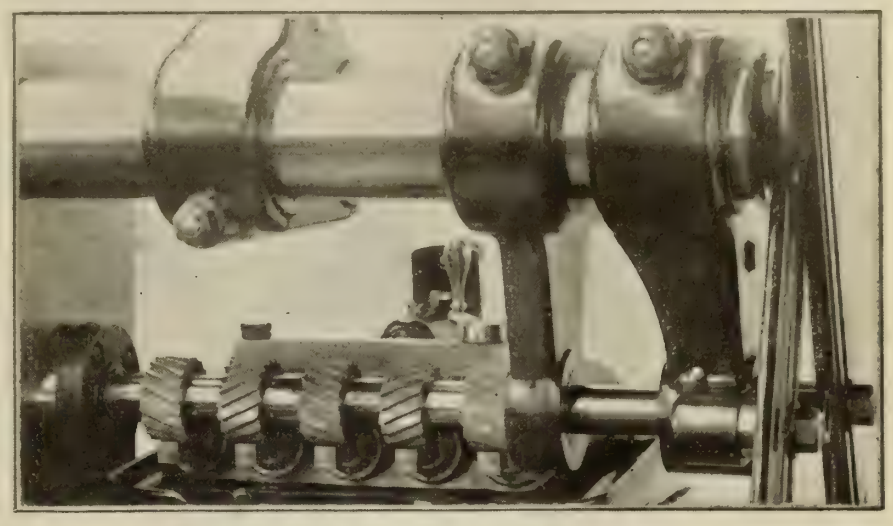

FIG. 5—MILLING SQUARE PUNCHES IN SERIES OF FIVE.

THE field of usefulness for milling machines has greatly increased within the past few years. At one time they were rather looked upon as a good type of machine for a limited variety of work, but that viewpoint has been entirely swept away, thanks to the necessity of increased production and interchangeability. Let anyone take a tour through a modern-equipped manufacturing plant and there they will see, not merely a few scattered milling machines, but regular batteries of them, all lined up to handle the work in operation sequence.

Whenever necessary, the regular machine is supplemented by special fixtures and cutters to increase production, the idea being to secure both speed and interchangeability.

Of course, there are numerous styles and sizes of such millers, but there is no need to enter into this phase of the question, as anyone desirous of becoming acquainted with the different types of machines on the market need only look through the advertising pages of any technical journal, such as the one they are reading. In fact, it is an education in itself to peruse and study the contents of the advertising pages of any up-to-date technical magazine.

It is not the intention of the writer, however, to moralize on the advantages of the advertising pages, so let us get back to the subject of milling machines. There is no need to delve into any particular design, for this information can be gleaned from the catalogue pages of the various makes. Let us leave all these points behind, and describe the phase of milling that the man in the shop is most interested in, namely, actual problems. We will, in as far as possible, illustrate a varied class of work, and we are indebted to the Kearney & Trecker Co., also the Kempsmith Manufacturing Co., both of Milwaukee, Wis., for the use of the illustrations in this article. They are actual examples of problems solved for various manufacturing plants by the makers of this particular type of miller, and show clearly what can be done in the way of miller production. Figs. 1 to 10 illustrate K. & T. practice, while Figs. 11 to 13 depict some work done on Kempsmith machines.

Let us commence at Fig. 1. This illustrates the milling of the faces of passenger car journal boxes for the Northwestern Malleable Iron Company's Milwaukee plant. This work is done on a No. 3-B plain machine, and from 1/16 inch to ⅛ inch of stock is removed, the time for each cut being one minute.

At present this concern is using two holding fixtures, one on each side of the table. The cutter is a 10-inch one, with inserted high speed bits, and runs at 38 r.p.m. The table travels at the rate of 6 inches per minute, and owing to the work being made of malleable iron, a soda water solution is used as a lubricant. A glance at the photograph illustrates clearly the nature of

FIG. 1—MILLING THE FACES OF PASSENGER CAR JOURNAL BOXES.

FIG. 2—MILLING THE SADDLES OF THEIR OWN MACHINES.

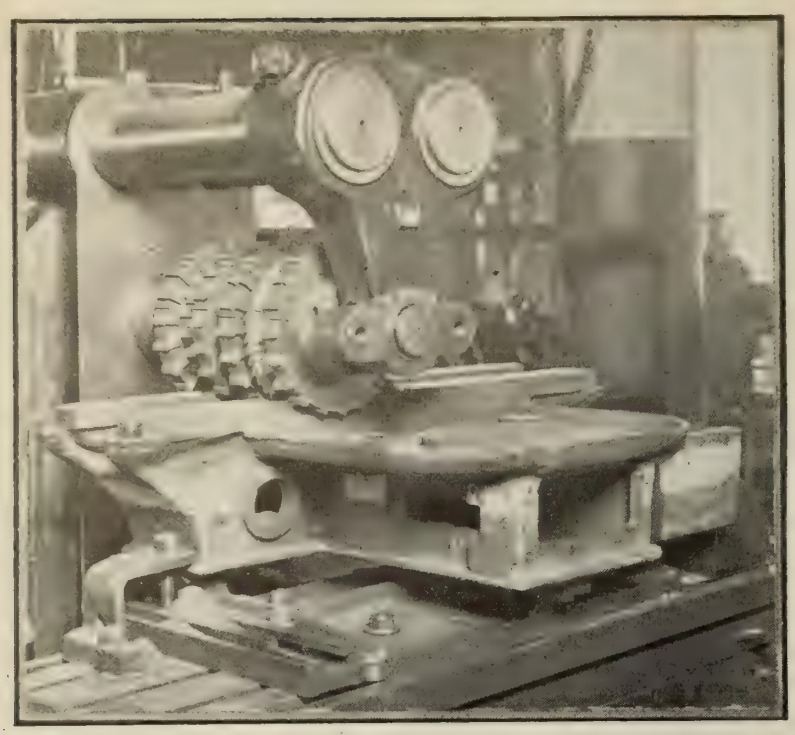

FIG. 3—MILLING THE WAYS OF A GRINDER BED.

the holding fixture, and it will be noted that simplicity has been combined with rigidity in the design of the work holder.

The next example, Fig. 2, is one adopted by themselves for milling the saddles of their own machines. A No. 3-B plain machine is again used, and, as can be noted the proposition is one of straddle milling, in fact a very wide straddle, as the outside cutter is approximately 30 inches away from the face of the column. The writer saw this operation being performed, and the rigidity of the machine was surprising. The double overarm is of course the true secret of the rigidity obtained, and although it is necessary to hold the piece being milled to limits of .001" plus, or minus, no difficulty has been experienced in so doing. It is a point such as this that makes or mars the success of a milling operation, and it is always safe policy to make sure that your milling arbor is well supported.

### Gang Milling

We will next consider some examples of gang milling, the first of which is shown at Fig. 3. In this view we see the milling of the ways for grinders made by the Ott Grinder Co., Indianapolis, Ind., and in fact the photograph was taken in the latter mentioned company's plant. A No. 3B plain machine is used, and the six cutters on the arbor are all of the inserted type, the bits being of high speed steel. Both sides and the top of one of the ways are milled, also both sides and groove in the other way. This operation is completed in one cut, and as can be noted the knee slide is being cut right out of the solid. The method of holding the grinder bed to the miller table is simple, yet very efficient, and it would be a good plan for readers to study each holding fixture carefully as they may later find a chance to adapt the same idea to other classes of work.

At Fig. 4 is shown an interesting example of rack cutting. The rack being cut is made of cast iron, and twenty-one 4-pitch tooth cutters are mounted on the machine arbor. The work is completed in one cut, and the double overarm, plus the arbor support, is largely responsible for the success of this operation. As the Kearney and Trecker Company puts it: "This work was really a test piece made to convince a prospect, and as can be noted the design of the piece did not allow us to use the arm braces. In spite of this the rack was cut from the solid, without the arm braces, and with perfect results."

### Another Example

Fig. 5 illustrates another example of milling, the work in this case being the milling of square punches. These punches have a 5 degree clearance to enable them to punch railroad tie plates, and five spiral slab cutters are used as shown.

The punches are held in a special five spindle indexing attachment, this fixture turning all five punches the necessary 90 degrees at a time. The work is performed on a No. 3B plain machine for the Whittaker Glaenster Co., Portsmouth, Ohio., and has proved very satisfactory. It will be noted that the five cutters are so arranged that the spiral of each cutter is oposite to the one next to it, this equalizing the torque on the arbor caused by the spiral angle. This is a point to be remembered when using a number of spiral cutters, especially if the cut is rather heavy.

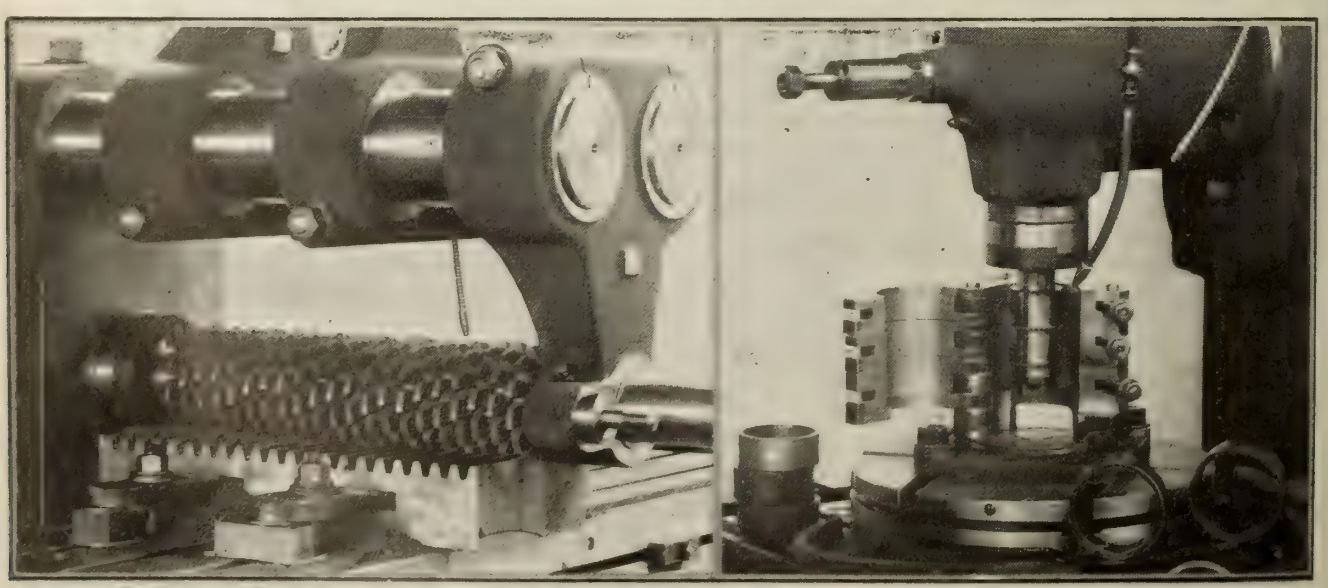

FIG. 4—CUTTING A RACK WITH 21 TEETH AT ONE CUT.

FIG. 7—A GOOD EXAMPLE OF THE VALUE OF VERTICAL MILLING ATTACHMENT.

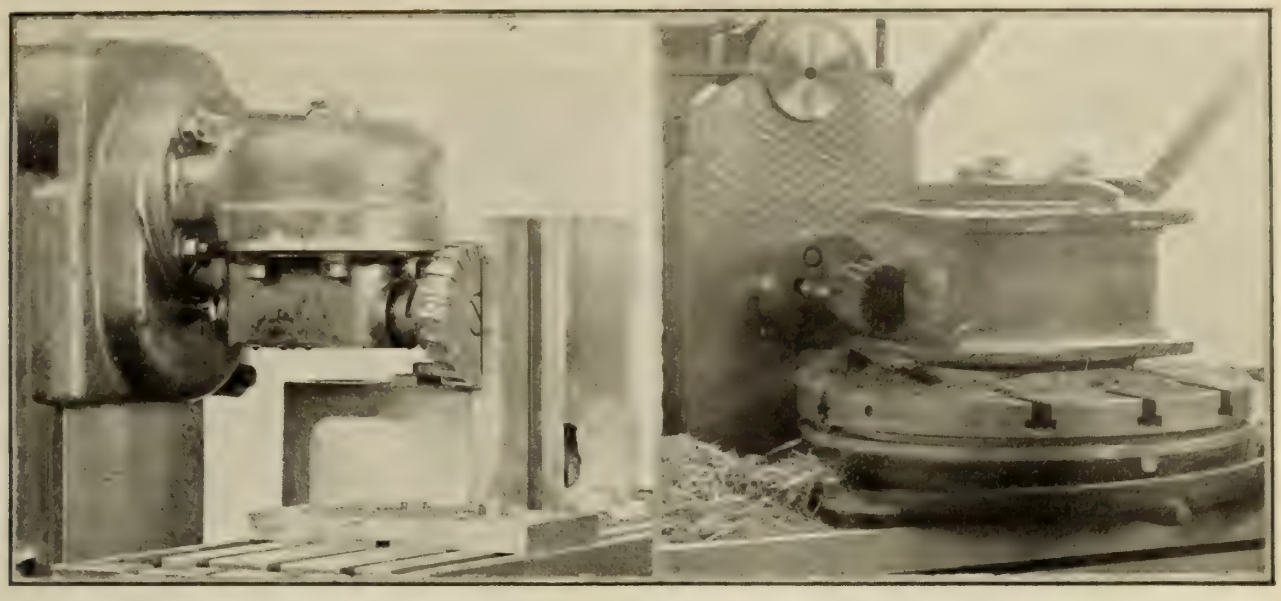

FIG. 6—USING THE UNIVERSAL ATTACHMENT.

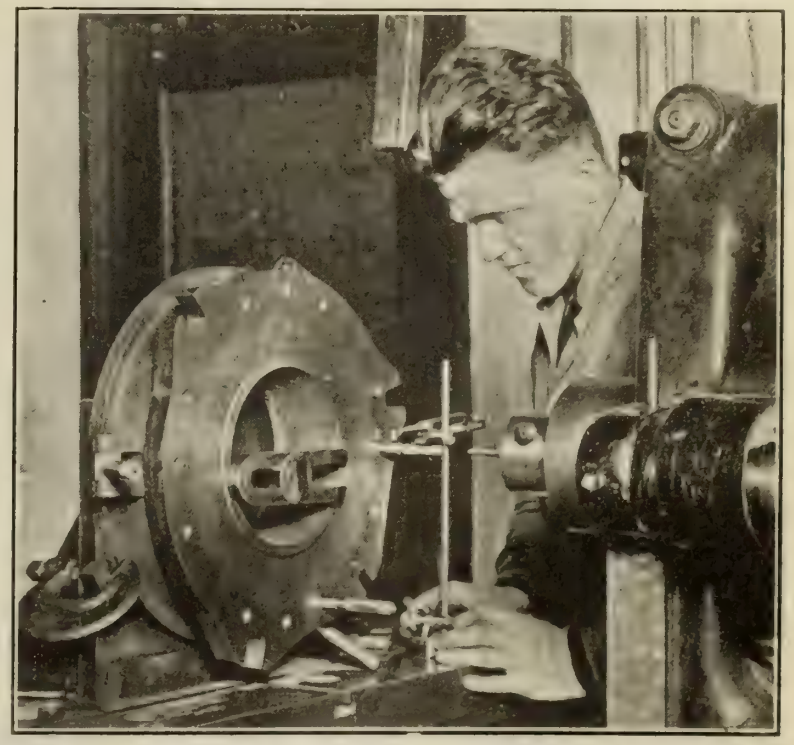
FIG. 8—MILLING LOCOMOTIVE CONNECTING ROD BRASSES.

**Universal Milling Attachment**

It is often good policy, in fact it is often necessary, to use some auxiliary attachment in connection with the regular machine to perform the work most efficiently. Such a case is shown at Fig. 6. Here we see a No. 3B plain machine fitted up with the universal milling attachment. The work being performed is the milling of the vertical inside face of the housing which cannot be reached by a cutter on the end of the regular horizontal spindle, the extension on the base of the housing preventing this being done. The next best thing was to use the universal attachment, and as this fixture takes very little time to fasten to the column, it is no detriment whatever. Machinists and toolmakers in general should familiarize themselves with the use of the various attachments, and for this reason we will show further on in the article different applications of such attachments. However, returning to the work shown at Fig. 6. The universal attachment shown can be set at any angle, and can be fastened rigidly in any position, the size of the chips coming from the work in the pres-



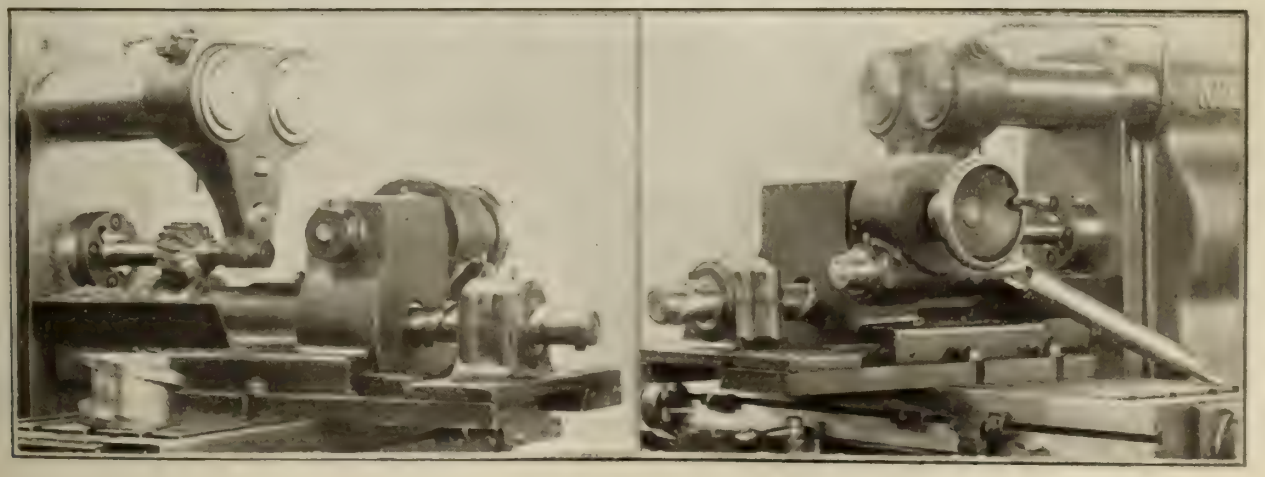


FIG. 11—USING THE MILLER FOR BORING OUT BUSHING HOLES.

FIGS. 9 AND 10.—FRONT AND REAR VIEWS OF A WORM CUTTING ATTACHMENT.

ent example being proof of this statement. There is many a job being done on other machines to-day that could be completed more economically, were the workers more familiar with the uses of milling machine attachments.

At Fig. 7 is depicted a very interesting operation on a No. 1½B plain miller, the vertical spindle attachment being used in this case. The work being performed is the milling of retainer spring grooves in the retainer rings of one of the styles of Hyatt roller bearings. Note the type of holding fixture used for this work. The fixture is attached to the rotary table, which is of course on top of the regular table, and after the three pieces of work are inserted in the holding fixture, the table is fed into the cutters by the table feed until the proper depth is reached. The automatic rotary table feed is now engaged, this giving the work a circular motion. The slitting saws used are 2 inches in diameter and are mounted on a heavy arbor to ensure rigidity. Needless to state absolute rigidity is necessary for work of this nature. The three cutters are 1-16 inch thick, and they cut the three rings in one minute floor to floor time. Samples of the work can be noted resting on the regular miller table.

### Milling Connecting Rod Brasses

In a previous paragraph in the present article the writer made a statement to the effect that many a job was being performed on other machines that could be better handled on a miller. To prove his assertion let us refer to Fig. 8. This view depicts the milling of locomotive connecting rod brasses on a No. 3B plain machine, the work being mounted on a rotary table that can be indexed at any angle. This allows the machining of the four sides at one set up. Three sides of these brasses are milled square, while an angle is milled on the fourth side for the take up work.

The size of the chips can be clearly noted in the photograph, and the work in this case completed in one hour and five minutes. In a great proportion of railroad shops this class of work is accomplished on the shaper, and approximately four hours are necessary to complete the job. On the shaper there is a chance of error owing to the different set ups necessary, so that in more ways than one, the miller is the better plan. This is only one case, but it proves conclusively that it pays to study your product, ascertaining if you are completing it in the best manner possible.

### Cutting Worms

The next two views are especially interesting, a front and rear view being shown. Fig. 9 illustrates the machine as it appears from the front, and in this case the attachment being used is a special worm cutting fixture. This attachment is fitted to a No. 3B universal machine, and a sample of the worm produced can be seen resting on the table. Briefly, here is how the worm is completed. The lead on the worm is obtained through the master screw which can be seen extended toward the front of the miller table. The power is furnished from the feed box to the attachment by a universal feed shaft as shown at right hand lower corner at Fig. 10. The worm itself is 5¾ inches diameter, and a cut of 2½ inches wide and ¾-inch deep is taken in this case. The worm is completed in 25 minutes. Here is an example of careful planning, and shows what really can be accomplished in the line of special fixtures. The attachment was made for the Visayan Refining Co., of the Philippine Islands.

The next three illustrations will depict Kempsmith machines in operation, and the first of these, Fig. 11, shows a rather interesting use for a miller. The work being done is the boring out of bushing holes in a jig plate. As will be noted the work is held on an angle plate, and the operator locates his boring positions by means of the surface gauge. This method of boring is very accurate, and just goes to show that millers can be used for more than mere manufacturing work. The material is cast iron, and we understand that the machine shown has been in use for the past five or six years.

Fig. 12 shows a No. 2 plain machine milling the slots on a small wringer bracket. The piece is of course held in a suitable jig, and the production obtained on this work is 40 per hour, or 360 per nine-hour day. The material is cast iron, and the depth of cut being taken is ½ inch.

The last example, Fig. 13, depicts the milling of splines on three rocker shafts. These shafts are made from 35-45 carbon O-H steel, and the work is to mill four splines on each shaft. The depth of cut is 1-16 inch, and work is held to limits of plus .003 inch and minus .000 inch. A dividing head is used to index the work, and the three dead centers can be clearly noted on the photograph.

Having thus led up from the very simple holding fixture to the more complex, we will leave the subject for the present, but will take up, in a later issue, still further examples of milling fixtures, some of these being of the continuous milling type.

## PENETRATION IN CASEHARDENING

In ordinary practice it is stated to be useful to include with the articles to be casehardened one or more standard mild-steel test-pieces. These, with all the other articles included in the charge of the pot, are subjected to the casehardening action; the degree to which this action has gone is judged by inspection of the fracture of these test specimens. So claim J. Galibourg and M. Ballay in the Institute C.E. Foreign Abstracts. The authors claim that the naked fracture of such specimens, whether unquenched or reheated and quenched, is deceiving; they therefore treat the fractured surface with a solution containing copper sulphate, the effect of which is to deposit copper differently on the carburised sections; this differential disposition is independent of whether the specimen is hardened or not; and it makes the evaluation of the depth of carburisation more exact.

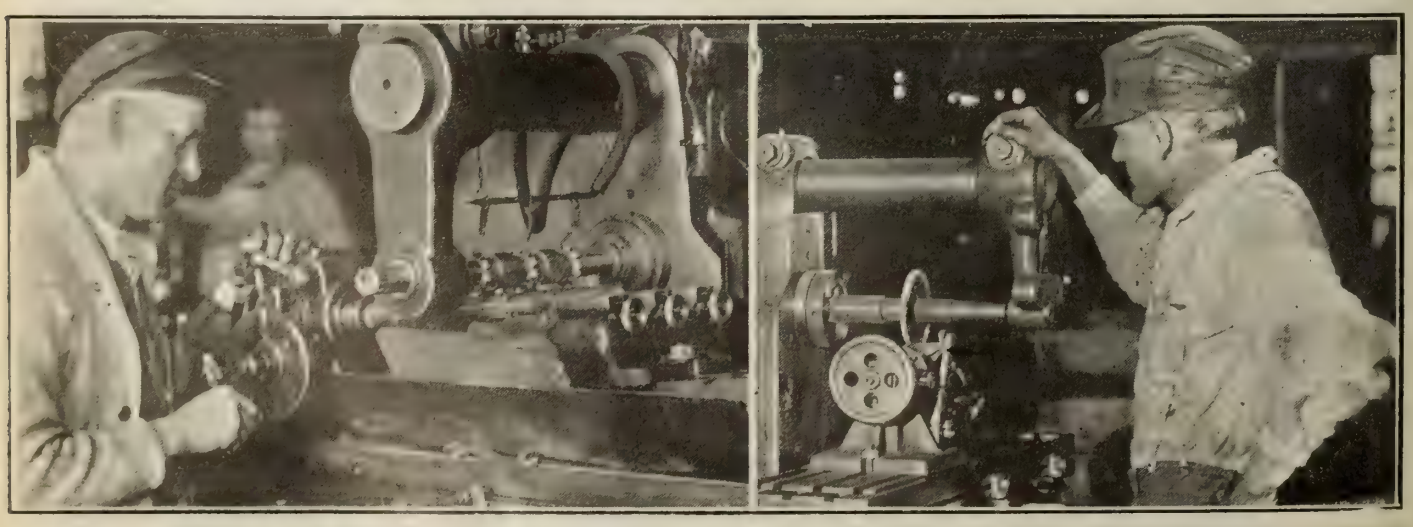

FIG. 12—MILLING SLOTS ON SMALL WRINGER BRACKET. FIG. 13—MILLING SPLINES ON THREE ROCKER SHAFTS AT ONE TIME.

# Producing Graduated Dials Economically

## Moderate Quantities Can be Produced Without Expensive Equipment—Automatic Screw Work—Knurling on Lathe, Reaming And Stamping Operations are Involved

By F. SCRIBER

THE making of dials in moderate quantities, accurate and at a reasonable cost, is apt to be rather a difficult proposition where suitable equipment is not at hand. In view of the fact that these are being used more extensively at present than in times past on all types of machinery, it is believed that the accompanying illustrations, which show a method of making a graduated dial without the aid of expensive equipment, will be of interest.

Fig. 1 is an illustration of a graduated dial that is to be machined, and shows the general proportions of this design. The dial is made of high-grade screw stock which is drilled out and finished all over. The first operations are performed on an automatic screw machine, the tools used in setting up the machine being shown in Fig. 2. Bar stock is used in this set up and is gripped in the revolving chuck on the machine. The various functions performed on the work are, first, spot drill; second, turn 1 7-16 inch and 1 5-16 inch diameters, at the same time drilling out the large holes. Third, ream the large hole, square the bottom of hole and chamfer; four, drill the small hole, turn the diameter at short end, form chamfer and cut off. Fifth, complete cutting off. Tools used are indicated over the various diagrams designated as first spindle, second spindle, etc., on drawing, Fig. 2, where it will be noticed that A is a short spotting drill held in a holder H. C is the tool used for turning the 1 7-16 inch diameter. Tool D is used for turning the 1 5-16 inch diameter, while drill E opens up the large hole. These are all contained in a box form tool F, which has adjustable shoes G and H for supporting the work while being turned. The split bushing I holds the drill in place, square-headed screw J being used for tightening. Over the diagram "third spindle" the reamer K is used for finishing the large hole. This reamer has one tooth cut across its end which is used to square the bottom of the hole leaving it slightly bevelled at the corner. A cutter L, held in a holder M, by screw N, is used to chamfer the end of the work.

Referring to the illustration over diagram "fourth spindle" the drill P opens up the small hole. This is held by bushing Q, in holder R, by means of set screw S, the bushing Q being split so it will securely grip the drill. Attached to the cross-slide of the machine by a suitable block is a formed cutter T. This turns the short length, chamfers

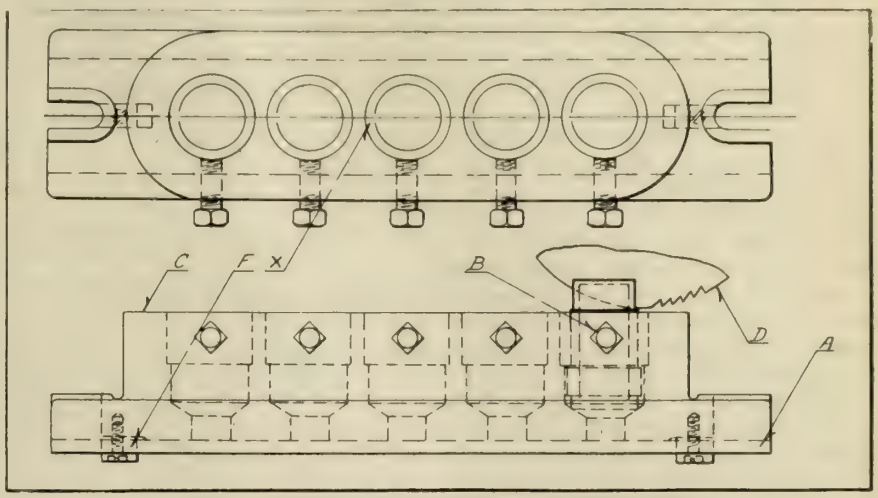

FIG. 3—FIXTURE IN WHICH SLOTS ARE MILLED.

the long bevel, and partly cuts off, while on the rear cross-slide of the machine the cutting-off tool U is mounted in a suitable holder W. This series of tools is arranged so as to permit the operations to be performed in the least amount of time consistent with a good quality of work.

It will be noted by referring to the first illustration that there is a slot across the end of the dial. This is milled by using a metal slitting saw. The object of this slot is to permit a split collar to clamp the dial in place on the machine. The fixture employed is shown by Fig. 3, and the manner of using it is quite obvious. A bushing A, or a series of bushings, one for each hole, of which there are five, are slipped over the 1 7-16 inch diameter of the work. The work is then located in the holes as shown, and the bushing which has previously been slipped over is clamped by a square-headed set screw B. Five parts are held simultaneously in the fixture, the body of which is indicated as C, this being made of cast iron. The bushing A, previously mentioned, is split at X and is made of tool steel hardened and tempered so it will spring together slightly and clamp the work. D indicates a section of a cutter, and the arrow shows the direction of rotation as it is fed into the work.

Another feature is that a slot E is cut under the lower side of the fixture. Into this slot the various clearance holes are drilled from the holes in which the pieces rest. This permits the

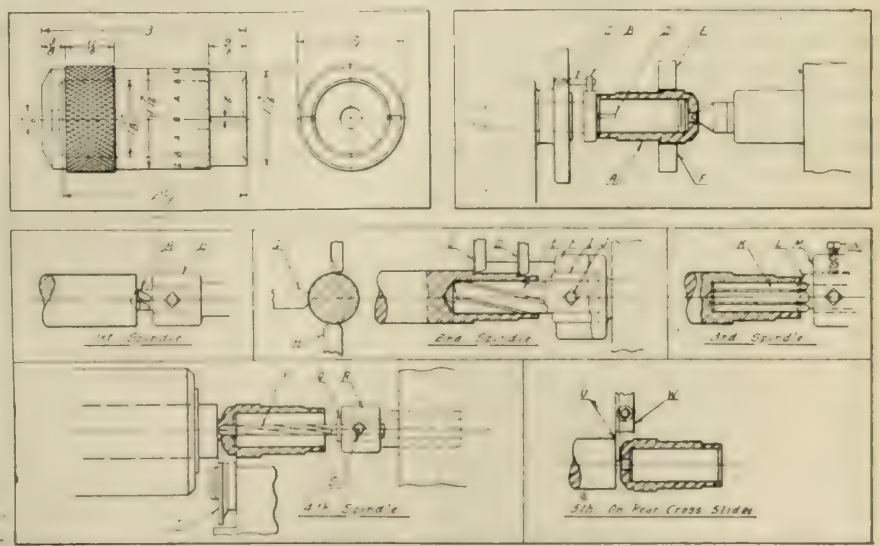

FIG. 1—UPPER LEFT VIEW. DETAIL OF THE PART.

FIG. 2—BALANCE OF VIEWS, SHOWING THE 5 SPINDLES USED IN DRILLING AND FORMING DIAL.

chips to fall through into the slot, after which they can be readily blown out by an air tube. Tongues are set into the fixtures and locate the same in the tee slot of the machine, all of which makes a very economical arrangement. Another operation which still has to be performed on this piece is that of knurling and this is very easily accomplished on a lathe using the tools shown in Fig. 4.

This consists of an arbor A which fits the spindle of the lathe. The arbor N has a pin B in it which comes in contact with a driving pin held in the face plate of the lathe. This causes the arbor to revolve under the strain of knurling so there will be no slippage. The tailstock of lathe is fitted with a spindle which can be quickly pulled back to remove the work, being operated by a lever with a spring arrangement. The work is slipped over the arbor into the position shown and the slot previously milled fits over a pin D which drives the work. The spindle knurl holder, having left and right-hand knurls, E and F, is fed across the work in the usual manner. It is next desirable to polish the dial, which is accomplished with a file and emery cloth on a speed lathe using a similar arbor, except that driving pins are omitted.

Referring to Fig. 1 it will be noted that the 1 7-16 inch diameter has numerals marked on it and indicating lines cut in its surface. In order to conform this surface and make all parts exactly the same size after filing and polishing, it was found desirable to compress it slightly in dies such as are shown in Fig. 5, where A and B are hardened steel plates with a very glossy surface which conforms to the diameter desired. C is the die holder which is clamped to the bed of the punch press. The dies are held to the holders by screws and dowels, and two guide pins E and F hold the two in alignment while the operation is performed. This die is constructed so that it will close the split end slightly. Next come two reaming operations. These are very economically performed in bench fixtures as there was hardly enough pieces machined at one time to warrant elaborate fixtures. The jig at Fig. 6 is for cutting the graduated lines on the periphery of the 1 7-16 inch diameter. The base of the fixture A is made of cast iron and has a plate B mounted on it, which is made in part with a hub to fit the hole in the base at C, This plate has a number of holes in it which correspond to the number of lines that are to be cut on the periphery of the dial. A plunger D enters these holes, spring E being used to force the plunger up. A pin F, which is pushed down by the operator, causes the spring to contract when it is desired to turn the plate from one hole to the other. Mounted in this plate is a stud G which

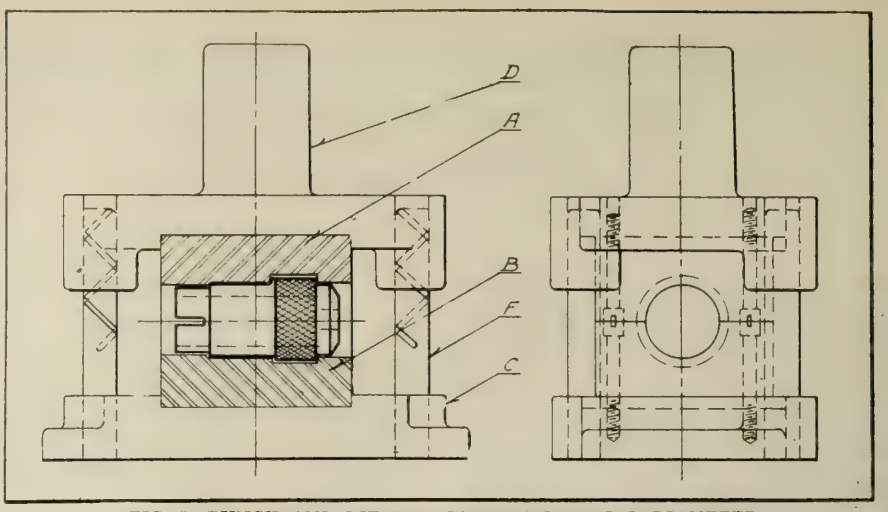

FIG. 5—PUNCH AND DIE FOR CONFORMING DIAL DIAMETER.

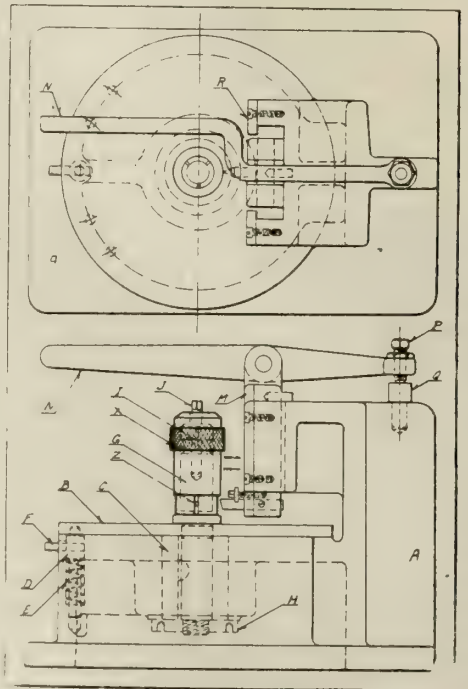
is held by a collar H threaded on its end. This collar likewise keeps the plate B in the base of the fixture. The dials X are slipped over this plug 6, the end of the plug being relieved and split. At I a tapered screw, having a square end J on it, expands the end of the stud, causing it to grip in the hole of the dial.

With the work thus clamped it is a simple matter to adjust the cutter K by means of the screw L so it will cut a line of the desired depth in the dial or work. To perform this operation the cutter is mounted in a slide M, the lever N being employed to move this slide up, its own weight, of course, keeping it down into the position shown. This lever has a screw P which comes against a pin Q, and the action of lifting the lever up causes the slide to be pulled up, thus cutting a line the required length on the periphery of the dial.

Graduated lines are cut on the body



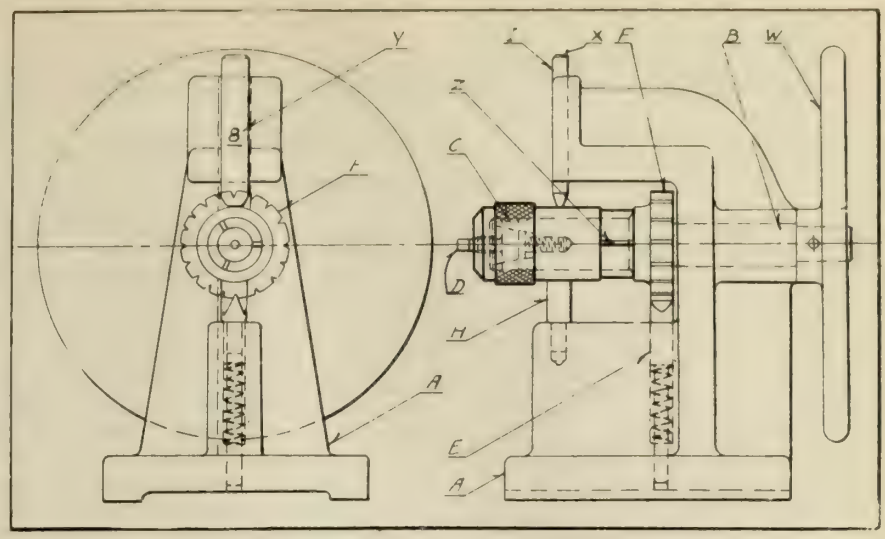


FIG. 6—FIXTURE FOR CUTTING INDICATING LINES.

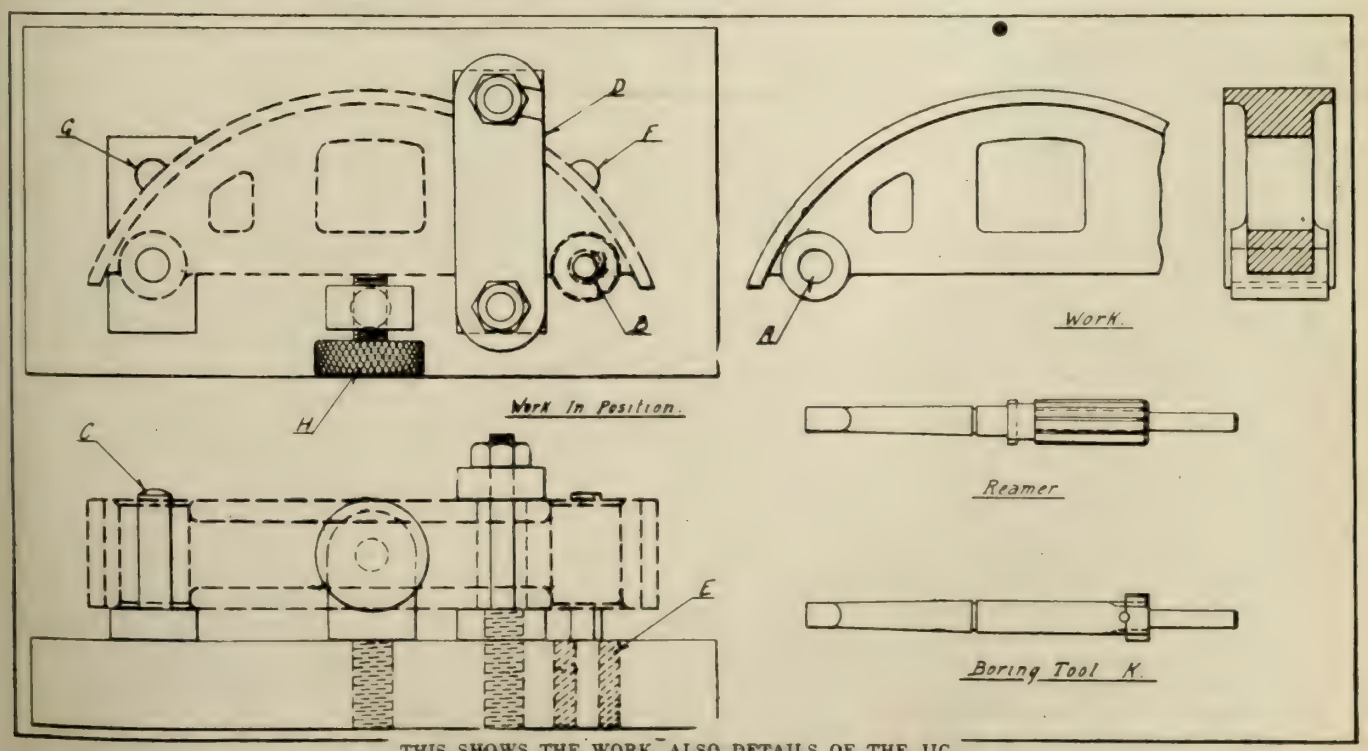
of the fixture and on the slide as indicated by arrows, and these lines match at either position as desired for either long or short lines, this governing the length of the same. The slide is of the square type held in place by straps R at both sides. After one line is cut, the operator pushes down pin F, indexes plate B to the next hole, cuts the second line, and follows this procedure until all lines are cut. Long or short lines are cut at each hole on the plate to indicate to the operator whether he is to pull the slide up to the indication mark for a long or short line on the slide. The starting point is also indicated on the indexing plate to guide against the cutting of one line twice which might possibly result in spoiled work.

The fixture Fig. 7 is used for stamping the numbers on the periphery of the dial. This fixture is constructed of cast iron, having a base A in which is mounted a stud B somewhat similar to that used in the preceding fixture, this stud is split at C and is expanded by the screw D to clamp inside of the dial. This is made so that the dial may readily slip on without removal of any parts. A spring pin E having a beveled top engages slots cut in the periphery of a dial F; these correspond to the number and lines on the work. A pin Z, not previously mentioned, is used in both this and the former fixtures to locate the dial radially, and hand wheel G is used for turning the arbor B, while the pin H is made to fit the outer 1 7-16 inch diameter of the work. In using the fixture the operator takes a steel stamp I which fits a slot in the body of the fixture, and holding it in the position shown, strikes it a blow at X, thus causing an impression of the number at the opposite end to be stamped in the work. He then turns the hand wheel G until pin E engages dial F at the next cut. After placing the next number in position he hits that with a hammer, likewise making the impression of the number on the dial. This is continued until all the numbers

are stamped in place. In this connection it should be noted that numbers are stamped on the hand wheel at W and also at Y on the stamps, and when a number is up at W the number on the stamp must correspond, thus guiding against errors in the marking.

As it is not necessary to maintain the same accuracy in numbering that is desirable when cutting the lines, a much smaller indexing dial is used on the marking fixture than that which is employed on the line-cutting fixture. While this equipment, with the exception of the screw machine tools, cannot be termed speedy operating, they are of the type which makes for a good degree of accuracy, and a fair amount of economy on repeat work required in small lots, such as used in machine building. They are, of course, of the type which are used by many manufacturers in building up a business before reaching the point where they can specialize on a few things of the large quantity type.



FIXTURE IN WHICH THE NUMBERING IS DONE.

## DRILL JIG WITH PILOT BUSH IN BASE

By G. BLAKE

The accompanying drawings illustrate a method of boring cored holes with the pilot bush in the base of the jig instead of in the top portion. The usual practice in jig drilling is to have the guide or pilot bush on the top side of the jig, with the drill or boring bar entering therein. In the case of cored holes it is often very difficult to prevent the drill from following the rough hole, even though it is well supported by the bushing. The work here shown is that of an aluminum brake shoe for an automobile. The hole A is first laid off and drilled and reamed without the use of a jig. B is the cored hole to be bored. After the hole A has been finished the shoe is placed in position as indicated, locating from the finished hole A on the stud C, and clamped down by the swinging clamp D. The boring bar K, with the pilot on the end, is fed down, the pilot passing through the cored hole and entering the guide bush E in the base of the jig. The jig is simply a cast iron plate machined on the base and provided with raised strips on the upper surface for locating the work, allowing about ½ inch between the bottom of the shoe and the top of the guide bushing, this space being necessary to avoid any possibility of the cutter coming in contact with the hardened bush, after the hole has been bored. The thrust screw H locates the work in position against the stop pins F and G. One of the chief advantages of this type of jig is that the operator can see the boring of the hole as it is in process. The finished size of the hole in this particular instance is 1⅜ inches, the cored hole being about one inch in diameter. A 1⅛ inch twist drill is used to rough out the hole before using the boring bar. A shell reamer on a floating arbor is used for finishing the hole to size. The boring bar pilot is provided with a helical groove for lubricating purposes; it is likewise case-hardened.

R. J. Barrie, of Galt, Ont., has purchased the Wragg Pattern Works of the same city. This plant is said to be particularly well equipped, and the present owner was previously one of the master craftsmen engaged by the former owners.

THIS SHOWS THE WORK, ALSO DETAILS OF THE JIG.

# Novel Method of Making a Surface Plate

*By T. Kenney*

MANY small and medium sized shops are admirably equipped with various types and styles of measuring instruments, gauges and fine tools of all kinds, but very few indeed can boast of having a first-class surface plate, one that can be absolutely relied upon, and without which it is impossible to measure with any degree of accuracy some of the complicated pieces of mechanism, jigs, fixtures, etc.

Before proceeding on how to make one perhaps a few words along historical lines may be of interest, and probably news to a good many of the younger mechanics. About 1830 the late Sir Joseph Whitworth, the eminent English engineer, was working in London, England, for a man by the name of Henry Maudslay, and he had to produce a perfectly true plane. Needless to say, it does not require an extraordinary amount of imagination to realize what a difficult task he had before him, especially when one bears in mind that the variety of machine tools were, at that time, limited. He had no standard or true plane with which to test his work when finished, or even to help him in making the one he had in hand. However, he came to the conclusion that in order to generate a true plane, and to be absolutely sure that he had produced one it would be necessary to produce three. This he was successful in doing, but not before a lot of thinking, and probably much more hard work. So far as the writer knows, there is no record of how long he was in producing these three true planes, but many years afterwards, in 1840 to be correct, Sir Joseph read a paper on the preparation and value of a true plane at a meeting of the British Association, and at that time pointed out that it depended upon the principle that, if any two of three surfaces exactly fit each other all three must fit, and consequently all three must be true planes and flat. Such great accuracy of workmanship was far ahead of what was contemplated at that time as possible in mechanical engineering, but Whitworth proved that it could not only be attained in practice, but also showed that it could be measured—truly a remarkable achievement at that period.

Coming to the present article. It will be seen upon referring to Fig. 1, which represents the three plates marked A, B and C that if A and B fit exactly, even though they are slightly curved, that is, A is convex and B concave (exaggerated in the diagram), B cannot possibly fit C, but would look as shown. By scraping each one and fitting first A to B, then B to C, and C to A, and repeating the operation time after time, a true plane in each case will be the ultimate result. When? That is, how far has this scraping to be carried before a practical, yet true, plane is in such condition as to say it is now OK. The writer, who has produced several, generally strives to have the finish markings and contact points not more than one-eighth of an inch apart at any place, in some cases less. Needless to say, the marking medium must be a mere suggestion for the finishing cut with the scraper, and after carefully cleaning the plate, then trying same with one or other of the plates already very slightly smeared with prussian blue or lampblack, the result should look like that shown in Fig. 2. You can then be sure of having a first-class and practically perfect surface plate.

### Question of Design

A good many designs are employed, but it is now universally conceded that a well ribbed plate having three feet, that is, a three point bearing, is the best in most cases, inasmuch as three feet are always in contact with the bench, whereas four feet are seldom all on the bench, the four point bearing making this condition practically impossible. This is an important point to remember, as it is a known fact that cast iron continues to work, be it ever so little, for a long time, therefore it will be readily seen that if the plate has four feet instead of three, one of the feet may be suspended in the air, as it were, for several days or weeks at a time. The stresses set up by this overhang would be the means of bringing about abnormal and troublesome warping, which may result in a permanent set, thus impairing the plate's accuracy. In such a case some day, someone might get badly fooled, and there would be no alternative but to rescrape the plate to a good standard before it could again be thoroughly relied upon.

### Size of Plate

A good size of plate for the average small shop is 10 inches wide and 16 inches long, or if one desires a larger or smaller one the same proportions will be found to be excellent, that is, the sides in the ratio of 5 to 8. Fig. 3 shows a plate of good general design which can be thoroughly depended upon in practice. It will be seen that the webbing is about the same thickness as the top, the sections being slightly tapered for drawing from the sand. This reduces the possibilities of unequal stresses. Some makers prefer to make the webs half the thickness as the top, and while this makes the plate lighter, the writer believes it sets up unequal stresses. As shown in Fig. 3 the depth of the webs from the top of the plate, for a plate

Fig. 1.

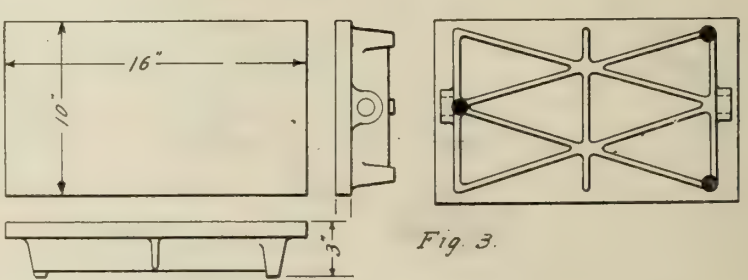


Fig. 3.

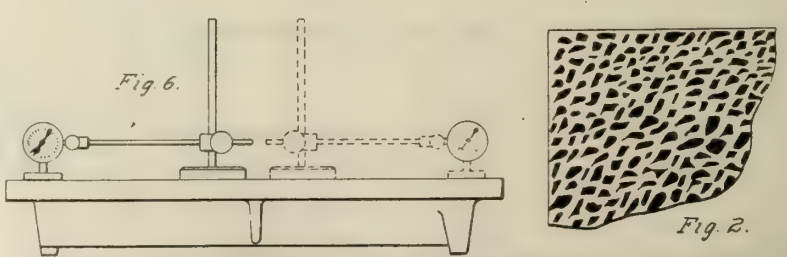

Fig. 6.

Fig. 2.

FIGS. 1, 2, 3, AND 6. REFER TO TEXT MATTER FOR EXPLANATION.

of the dimensions given, should not be less than 3 inches to insure rigidity.

After having made the pattern, a casting of good grade iron should be secured, not too hard, but of a close grain. Previous to machining these should be very thoroughly peened all over to relieve internal stresses. This precaution against subsequent warping is well worth the time and adds very materially to the length of life and accuracy of the finished plate. The three plates are now ready for machining on the feet, top and sides, after which they can be set on one side for several months, or used as rough marking off plates, provided they are not ill used. After a lapse of from six to nine months they can be again machined all over, taking great care to have the sides as nearly square as possible. The top is now given a finishing cut, which is done with a shaving tool

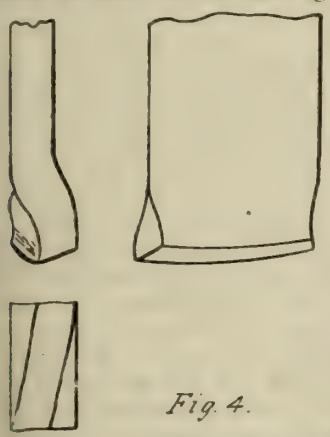

Fig. 4.

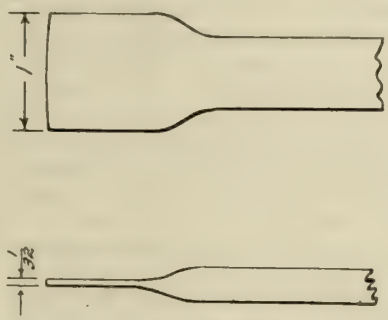

Fig. 5.

FIGS. 4 AND 5.—SHOWING THE TOOLS USED.

shown in Fig. 4. This is a very old fashioned tool, but a good one nevertheless, and the writer can strongly recommend it as one of the best where a first-class finish is desired. The twist of the cutting edge is about 15 degrees, and the cutting edge is slightly convexed. It should be tempered to a dark straw, then carefully ground and stoned, producing a very keen and even cutting edge. If this tool is nicely made and care taken in storing, practically no wear takes place, as the action of the tool is one of shaving rather than actually cutting, whilst the finish is superb.

After the finishing cut the plates are marked, A, B and C, and one, usually the one that appears to have the best face, say B, should be smeared with prussian blue or lampblack. This marking medium should be spread evenly upon its face, then the plate is rubbed with a circular motion with its face on, say, plate A. In the early stages this testing of one plate on another need not be of long duration, as the plates will be found to be far from flat, and much roughing down with the scraper will be necessary before one can settle down to the real job. The three plates are worked alternately, always carefully cleaning the one scraped. By using turpentine the scraping will be found to be much easier.

A suggestion or two on the scraper used will not be amiss. The writer has seen a variety of these, some very handsome tools indeed, but that is all. A first-class practical tool can be quickly made out of an 8 inch flat file, with about one inch of the tip broken off. It is first ground to eliminate the teeth, then flattened to about 1-32 of an inch, and re-ground to shape, and about 1 inch wide, similar to that shown in Fig. 5. It is then hardened dead hard, taking care not to burn the thin cutting edge during the heating. It should be oil-stoned with the cutting edges square with the faces, and finally finished on an Arkansas stone. You will find that this scraper will actually cut, and not scratch.

When on the finishing cut of the plates have the scraper in the keenest condition and merely pick off, as it were, the marked portions, taking care to use just about the same strength of cut at all times during the operation. If the cuts are taken first in one direction and then in another much better results will be obtained. It is a heavy, tedious job, but when finished such a plate is a pleasure to work over and it can truly be classed among the gauges.

A good method for testing the surface against any subsequent warping is shown in Fig. 6. A lapped test block of small area is placed at one corner, then a surface gauge, carrying a test indicator is placed about the centre of the plate with the test indicator registering, .005 on the test block. The test block is then moved to another corner and the reading of the indicator should be the same, and so on for the four corners. After this different places on the plate's surface can be tried in the same manner, and if no appreciable difference is shown on the indicator, one can rest assured that the plate has not "moved" to any serious degree. If, however, you can borrow a standard plate, known to be in good condition, it will not be necessary to make three plates, as the one in hand could be scraped and tested by this, although way back in the thirties there was no such thing as getting the loan of a plate, or even reading of the method employed in producing a true plane.

## HEATING DROP FORGE DIES

A rather interesting patented method of heating drop forging dies is spoken of in a recent issue of the "American Drop Forger." This idea is patented by H. R. Reinhardt, and here is what he has to say:

"My method is to increase the life of drop forge dies by keeping them during use at a temperature considerably above atmospheric and somewhat below the hardening temperature of the die. In general, the temperature at which the tools or dies are to be kept during periods of active use varies from 300 degrees to 1,100 degrees F., depending on the characteristics of the steel or alloy of which the die or tool is made. Dies of ordinary carbon steel, containing from .75 to .90 per cent. carbon, should be kept at a temperature of 400 degrees to 500 degrees F. For this material, the lighter the dropping-weight of the machine in which the die is used, or the lighter the stock of which the forging is to be produced, the lower the temperature at which the die should be kept. A high-speed tungsten-steel die containing, say, 16 per cent. tungsten, 3.4 per cent. chromium, .8 per cent. vanadium, and .65 per cent. carbon, should have a working temperature of 1,100 degrees F. A steel containing 2 per cent. tungsten, 1 per cent. chromium, .80 per cent. silicon, and .45 per cent. carbon, which is much used for dies for hydraulic bulldosing and compression work, as well as hot-trimming and blanking, should have a working temperature of 500 degrees F. A die for hot-trimming, drop-forging, and hot or cold bolt-heading, made of steel containing .90 per cent. carbon, .40 per cent. manganese, 3.50 per cent. chromium, and .20 per cent. silicon, should have a working temperature of 750 degrees F.

There are various ways by which this heating of the dies may be accomplished. The tool may be surrounded with a jacket packed with infusorial earth or with fine molding sand, the whole apparatus being heated with gas-burners. Where the required temperature is relatively low, a bath of oil, lead, or lead-and-tin alloy may be used. By varying the proportions of lead and tin in the alloy, almost any melting-point between 400 degrees and 600 degrees F. may be obtained, thus furnishing a simple method of attaining and maintaining the proper temperature.

## CUTTING SOFT METALS

In cutting copper, tin, lead, or, in fact, any soft metal, it is good policy to see that a small amount of water is kept in the cut already made. If this is done it will be found that the metal separates easier and the edge of the saw keeps in good condition longer than when dry cutting is done. Even an ordinary chipping chisel does better work when the edge is kept wet than when it is dry.

# Present Day Illumination Standards

## Artificial Lighting Now Considered an Asset Rather Than a Liability—Careful Placing of Machines Necessary if Artificial Lighting is to Accomplish Its Purpose

*By GEORGE C. COUSINS

IN planning the layout of machinery in factories the relative importance of daylight and artificial light is frequently not given sufficient study, with the result that machines are placed so as to utilize daylight under best conditions. This arrangement often complicates utilization of artificial light to the best advantage. Daylight has usually been considered satisfactory and has been used as a reference standard in the absence of real data on the actual conditions.

Surveys of daylight illumination in factories have revealed the fact that in many plants the natural illumination is inferior to good artificial lighting. The following is a typical example: A machine shop is built with practically continuous window area on south, west and north walls. On a clear cloudless morning measurements of intensities at the benches near the windows showed over 50 foot candles (ft-c.), while about 30 feet from the windows the intensities at the work points of machine tools ranged from 3 to 14 ft. c. In some cases artificial light was used to supplement the daylight. The shop under consideration was on the second floor of the building, there were no high buildings within several hundred feet and a clear sky exposure is obtained on all sides. This is a very favorable condition. Where buildings are grouped together so that the sky is obscured the conditions would be very much worse. A more extended study of daylight intensities in 18 factories showed average intensities ranging from 1.5 to 10 ft. c. for lower grades of work and 4 to 18 for finer grades.

These results tend to show that daylight illumination in factories is not as good as is ordinarily supposed to be the case and that the distribution of daylight is far inferior to that of reasonably good artificial lighting. As a result of the knowledge of these conditions it has been proved that artificial lighting can be economically produced that is superior to daylight in both average intensity and distribution, and that when the lighting system and the machinery or work spaces are properly co-ordinated, the resulting illumination will have the greatest all-day effectiveness and manufacturing can be maintained on a really productive basis throughout the entire day.

For many years the conviction of illuminating engineers has been that factory output could be increased by the use of high intensities of illumination, but the putting of this opinion to the test was a difficult problem and it required some strong action to break the ice of opposition.

*Abstract of paper presented at the general professional meeting of the E. I. of Canada at Toronto.

### A Convincing Test of Better Lighting

The problem was attacked in a rather novel manner by the Commonwealth Edison Co. of Chicago. Their engineers approached a number of manufacturers, at whose plants accurate cost records were kept, with the proposal to instal trial lighting systems to produce three times the intensities previously recommended for the various classes of work. Records of cost and output were to be kept for a month under the existing lighting systems, then for a month under the new and finally a reversion to the old systems for another month. This was expected to furnish reliable data on the unit cost of output. The results were so gratifying that all the trial systems were retained as permanent, and in some cases the manufacturers would not permit a reversion to the old systems, realizing that it would mean financial loss. Some of the effects of the high intensities were that the increase in production was from 10 to 20 per cent., with a maximum cost increase of 5.5 per cent. of the payroll. In one case the production was increased 15 per cent., with no increase in the cost. The increased economy is due to more work being turned out with a decrease in the amount of spoiled and defective work. The indirect beneficial results to the workers in the form of more cheerful surroundings, cleaner shops, less eye strain and fewer accidents react to the benefit of the manufacturer in keeping the working force in a more efficient and contented mood.

*POINTS OF INTEREST*

*Proper artificial lighting is essential, if productive night work is to be obtained.*

*Watch the relative importance of daylight and artificial light. Study both conditions.*

*Artificial lighting can be produced economically, at the same time making it superior to daylight if properly distributed.*

*Increase in both production and pay roll is possible if light is of sufficient intensity.*

*Artificial light is used on an average of 5 hours per day throughout the year. In view of this figure, the subject requires proper attention.*

A very important phase of the effects of high intensity is its effect on the accident rate. About ten years ago approximately 24 per cent. of industrial accidents were caused by poor lighting, by improving the lighting conditions this percentage has been reduced to about 15 per cent. The economic loss caused by these accidents amounts to approximately $300,000,000 per year in the United States, which is more than the yearly lighting bill.

The relative importance of daylight and artificial light may be estimated from the fact that artificial light is used on an average of about five hours per day throughout the year. This is roughly about 50 per cent. of the working day and in view of this the importance of giving proper weight to artificial lighting is evident. When plants are operated at night the balance is overwhelmingly in favor of artificial light.

Here are some figures showing the intensity recommended for different kinds of work. These figures are stated in foot-candles. Shipping rooms, 1.5 to 2.5; paint shop, 2.0 to 4.0 for coarse work and 4.0 to 8.0 for fine work; passageways, .25 to .5; metal pattern dept., 4.0 to 6.0; power house boiler room, .8 to 1.5; engine room, 2.0 to 3.5; sheet meta dept., 3.0 to 6.0; average factory—assembling 4.0 to 7.0, drills 2.0 to 4.0, millers 3.0 to 6.0, planers 3.0 to 5.0, rough manufacturing 1.25 to 3.0, fine manufacturing 3.5 to 6.0, special cases of fine work 10.0 to 15.0; forge and blacksmithing—ordinary anvil work 2.0 to 4.0, machine forging 2.0 to 3.0, tempering 2.0 to 4.0, tool forging 3.0 to 5.0; foundry—bench moulding 1.0 to 3.0, floor moulding 1.0 to 2.0.

Stairways, 0.25 to 0.5; steel work—blast furnace (cast house) 0.3 to 0.5 loading yards (inspection) 0.3 to 0.5 mould, skull cracker and ore yards 0. to 0.3, open hearth floors (soaking pit and cast house) 0.1 to 0.3, rolling mill 1.0 to 2.0, stamping and punching shee metal 2.0 to 5.0, stock room 0.8 to 2.0 transfer and storage bays 0.5 to 1.0 unloading yards 0.1 to 0.3, warehous 0.5 to 1.0; stock rooms—rough materia 1.0 to 3.0, fine materials 2.0 to 4.0; sto age, 0.25 to 0.5; wire drawing—coars 2.0 to 4.0, fence machines 2.0 to 5.0, fir 4.0 to 8.0; woodworking—rough 2.0 4.0; fine 3.0 to 5.0.

### Revised Estimates

The figures given show the intensiti recommended for various classes of wo in 1916. A reference to a few of the might be interesting for the sake comparison. Machine tools were list as requiring from 2 to 6 ft. c., rou manufacturing 1.25 to 3, fine manufac-

turing 3.5 to 6, special cases of fine work 10 to 15, drafting 7. Compare these with some of the recent installations; for an aluminum working plant 14 ft. c., a drawn steel factory 15 to 16 ft. c., manufacturing automobile springs 21 to 22, ordinary machine shop work 10 to 11 and punch presses 6 to 10. These cases do not require particularly fine work and yet the intensities are equal to or greater than daylight intensities in many factories.

As far as can be learned all the installations of high intensities have resulted in economy and are considered good investments. How far high intensity can be carried before the limit of economy is reached is problematical, but that limit has not yet been reached. It appears evident, however, that as intensities are increased the increase in economy will be by smaller increments and that the gain resulting from an increase in intensity of from 10 to 15 ft. c. would not be as great as it would from 5 to 10.

Considerable headway is being made in the elimination of drop cords. In some cases workers have clung so tenaciously to these that their removal has resulted in mutiny. In some operations they are indispensable, and to provide for such contingencies in up-to-date plants they are kept in tool check rooms and supplied as special tools being returned when the operation requiring them is completed. Experience has proved that there are very few industries that cannot be lighted quite satisfactorily by overhead units. Drop cords are relics of the early days, when carbon lamps were the only suitable electric lamps for interior lighting, and should find no place in modern installations of high-powered lamps in suitably selected and placed reflectors except in special cases where overhead light cannot reach the point where work is being done. The practical solution of the elimination of drop cords is the correct placing of lamps relative to the work places or vice-versa. In large plans of mill construction it is sometimes necessary to provide individual lamps for machine tools placed in open bays. In some cases flood lighting units placed close to the ceiling are suitable and for others an adjustable lamp with its reflector is mounted on the end of a pipe arm which can be adjusted horizontally through an unthreaded T, which can in turn be raised or lowered on the end of a telescoping upright. By this means a substantial construction is provided without the dangers accompanying exposed insulated wire.

### Office Lighting

On account of the connection of offices with factories some of the improvement in the lighting of the latter has extended to the former. Office work as a rule does not require as high intensity as factory work, but requires more refinement in the form of diffusion. One of the important factors in the success of office lighting is the elimination of bright reflections from furniture and paper surfaces. This has been very successfully accomplished by the use of semi-indirect and indirect fixtures. It has been found that the eye suffers less fatigue under indirect than under any other type of fixture. The dense bowl semi-indirect unit gives practically the same illumination effect and the more dense the bowl the less eye fatigue is caused. Considerable improvement has been made in the design of semi-indirect bowls during the last few years. These are mainly in the way of dust proof units. Totally enclosing units can now be obtained that have all the good qualities of the open inverted bowls with the dust proof feature of enclosing globes. Some of these have reflecting domes above the bowls for use where ceilings are not suitable for use as secondary light sources and others have clear glass tops. Other fixtures are equipped with automatic cleaning devices operated by the same pull-chain that operates the switch. Every time the lamp is lighted or extinguished a felt squeegee makes a complete revolution of the interior of the bowl, removing all dust. About 5 to 10 ft. c. might be considered as representative of good office lighting at present, although there are some installations of from 14 to 19 ft. c.

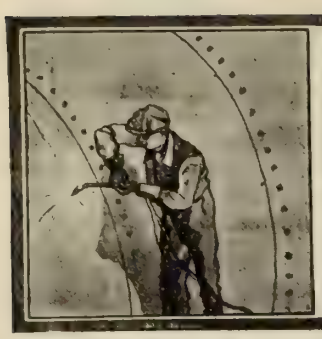
The period of transition from daylight to darkness when the fading daylight must be reinforced by artificial light has always been one of the difficult problems to solve. During this period the eye is attempting to work under two conflicting conditions. It is adapted to the color of daylight and the introduction of the yellower artificial light disturbs its condition of equilibrium; comfortable vision is not obtained until artificial light dominates the situation and the eye becomes adapted. To reduce the annoyance of this period C2 mazda lamps have been found very successful. The color of this light, nearly white, blends with the daylight and work can be carried on with very little interference.

In the foregoing only the monetary aspect of artificial lighting has been considered. The physiological aspect has been studied, showing the effect of intensity of illumination on the working of the eye. This investigation was conducted over a range of intensities from 4 to 36 ft. c. It was found that with increasing intensity a gain was obtained in visual acuity, power to sustain acuity, speed of discrimination and speed of adjustment of the eye for clear vision at different distances, figs. 4, 5, 6 and 7. These gains were greater for eyes with slight uncorrected defects than for normal eyes and there are indications that the middle-aged and aged eyes are benefited more than young eyes. The increase in acuity is very rapid up to about 5 or 6 ft. c., after which it becomes more gradual. The other functions of the eye that are affected by time show a more gradual gain at lower values and more rapid at higher intensities. The power to sustain acuity of vision shows the greatest increase.

These functions of the eye all have a very direct bearing on the amount and quality of work that can be performed by an individual and the ease with which it can be done and a knowledge of their performance under varying intensities of illumination proves that increased production with increased intensity is based upon sound physiological facts and is the logical result. It also points the way for the conservation of the eyesight of the people and the elimination of the evils that have resulted in the past from prolonged use of poor lighting.

In view of the conditions under which high intensity lighting has been evolved, it is not surprising that the greatest improvement has been made in the industrial field. The value of high intensity has been firmly established from both the economic and hygienic viewpoints and there are strong indications that we are in the threshold of a new era of artificial lighting that will include all branches of industry and commerce.

## RIVET CUTTING RECORD



What is believed to be a record for cutting rivets in the dismembering of steel freight cars was recently established by an operator who cut out 1,308 rivets in 2 hours and 46 minutes. Of this number 683 were ⅝-inch rivets, 228 were ¾-inch rivets, and 127 were ⅞-inch rivets.

The cutting was done on a standard Erie car under general yard conditions, the operator taking the rivets as they came, working inside, outside and under the car. The car was one that had been retired from active service and that was in the car shop for repair, the rivets and plates being covered with heavy scale and rust, thereby rendering the cutting extremely difficult.

It is said that the record applies not only to the number of rivets cut in the time required, but also to the low consumption of gases used, the job taking only 384 cubic feet of oxygen and 83 cubic feet of acetylene. The operator used an Oxweld cutting blowpipe with a rivet cutting nozzle.

## AUTOMOBILE INDUSTRY HAS A BETTER OUTLOOK

There is a much better feeling existent regarding the automobile industry. Representatives of Wall Street brokerage houses state that production is still about 50 per cent. of capacity, but many companies are receiving new orders. This is particularly true of the manufacturers of parts, indicating that motor car manufacturers have used up their supply and the fact that they are buying parts was taken to mean that motor car buying is on the increase.

# WELDING AND CUTTING

# Hints on Oxy-Acetylene Welding and Cutting

## Care of Welding Rods—The Use of Fluxes—Manipulation of Blowpipe—Proper Adding of Welding Rod

STEEL and iron welding rods should always be kept in a dry place to prevent rusting. If they do become rusted they must be thoroughly cleaned before using.

### Fluxes

Some metals do not flow together readily under the action of the blowpipe flame. By using a suitable flux this difficulty is overcome. A welding flux is a combination of chemicals in the form of a powder which assists fusion and either prevents the formation of oxides, or breaks down oxides when formed; or, as in the case of grey cast iron, keeps the carbon in the "graphitic" or free state.

Flux should not be sprinkled on the weld, but should be applied by dipping the heated welding rod from time to time into the flux, enough of which will adhere to the rod. Flux at all times should be used sparingly.

Fluxes always should be kept in air-tight tins, as some absorb moisture and others deteriorate if exposed to the air for any length of time.

For successful welding, it is absolutely necessary that the proper flux be used. Fluxes should be purchased from a reliable company, preferably from one making a specialty of this particular line and recognizing fully the conditions to be met. Cheapness should never be a guide in the purchase of this material.

### Manipulation of Blowpipe

The blowpipe must be grasped firmly but not rigidly in the hand. It is not good practice to hold it in the fingers, because it is impossible to manipulate the flame with as great regularity and control, nor will it be possible to do as heavy work without tiring.

Occasionally the hose is thrown over the man's shoulder. In this case the weight of the blowpipe is suspended and held by the tubing, so that it is only necessary to impart the typical welding motion to the blowpipe, which can usually be done by the fingers. The movement of the welding flame is hindered, however; and this method is therefore not recommended, and should be used only as a relief when the work is of long duration and the operator's wrist and forearm become tired.

The head of the blowpipe should be inclined at an angle of about 60 degrees to the plane of the weld, as in Fig. 15.

*This information will be continued in later issues, and we will take up the subjects of irons and steels, pipe welding, cast iron, etc. We are indebted to the Oxweld Acetylene Co. for the use of this material.*—EDITOR.

The inclination of the head should not be too great, because the molten metal will be blown ahead of the welding zone and will adhere to the comparatively cold sides of the weld. On the other hand, the welding head should not be inclined too near the vertical because the preheating effect of the secondary flame will not be efficiently applied.

There are certain cases, however, where the conductivity of the metal is such that it is not necessary to utilize this preheating. Also certain metals have the property of absorbing the gases of this flame. Consequently, in these cases it is best that the flame impingement be concentrated to as small an area as possible.

The motion of the blowpipe should be away from the welder and not toward him, as closer observation of the work can be obtained and greater facility in making the weld will be experienced.

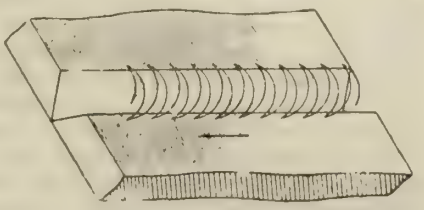


FIG. 16—MOTION OF FLAME FOR WELDING

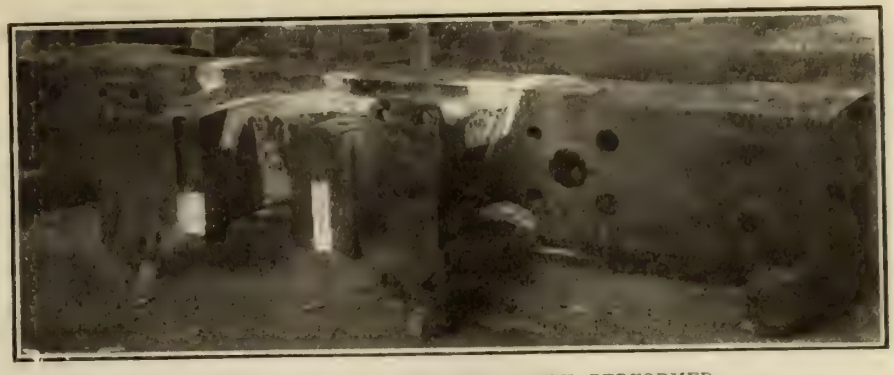
Where thin sheet material is being welded and it is not necessary to use a welding rod or wire, a weld may be produced by moving the blowpipe in a straight line. It can readily be seen that this does not apply to welds which have been bevelled, and which require the use of filling material, for in this case a swinging motion must be imparted to the blowpipe to take in both edges of the weld and the welding wire at practically the same time.

In comparatively light work a motion is imparted to the blowpipe which will cause the incandescent cone to describe a series of overlapping circles, the overlapping extending in the direction of the welding. In order that the weld be of a good appearance this must be constant and regular in its advance. The width of this motion is dependent upon the size of the material being welded and varies accordingly with the nature of the work.

In heavier work, if the above system were used, a great deal of the motion would be superfluous. Consequently either an oscillating movement or one in which the jet of the blowpipe will describe semi-circles should be used (Fig. 16). This confines the welding zone and while the progress is not so fast, it is more thorough than the other system for this class of work.

To the average beginner the regular control of these motions is difficult, and considerable practice is required to become skilled. It is the regularity of these motions that produces the characteristic even-rippled surface of good autogenous welding. The progress of a welder and the quality of his work can be determined to some extent by the skill with which he produces this effect.

After the swinging motions of the blowpipe have been mastered, the next step will be to introduce the welding rod into the weld in such a manner that the regular advance of the blowpipe will not be hindered nor retarded. It can be seen that there is quite a little attention needed to secure perfect co-operation between the two hands, one controlling the blow-



pipe and the other adding the welding rod.

The welding rod should be held and inclined as shown in Fig. 17. In this position sufficient quantity of metal may be added at the right time. With the welding rod held in a vertical position or horizontal, the possibility of the addition of an excess of metal, part of which is not fused, is great. In adding this metal, care must be exercised that the edges of the weld are in the proper state of fusion to receive it. If the metal is not sufficiently hot, the added material will merely stick to the sides and fusion will not exist. It is therefore necessary that, by the motion of the blowpipe, fusion be produced at the edges of the weld equal with that of the welding rod.

The usual faults of the beginner are failure to introduce the welding rod at the proper time into the welding zone, to hold the rod at the wrong angle, or to fuse either too little or too much of the rod. The filling material when melted should never be allowed to fall into the weld in drops or globules. When the proper time arrives to add it, the welding rod is lowered into the weld until it is in contact with the molten metal of the edges. When in this position the flame of the blowpipe is directed around it, and thus fusion is produced. It is customary to add metal in excess to that of the original section. There are several very important reasons for doing this. First, the weld is reinforced and the strength is accordingly increased. Second, in case a finished surface is desired a sufficient stock must remain to allow for finish. Third, small pinholes or blowholes may be found just under the surface of the weld, which do not extend to any depth, and may be removed by filing or machining.

The welding of different kinds of metals very often requires different methods, all of which cannot possibly be covered under any general rule. For this reason we will consider these subjects in a later issue.

H. Massicotte and Freres, Inc., Cap de la Madeleine, Que., intend erecting a plumbing shop and public hall costing $10,000.

THIS VIEW SHOWS THE WORK PERFORMED.

## ANTI-CARBURIZING PAINT

As is well known, it is necessary on occasions to localize the effects of case-hardening. Messrs. Alfred Herbert, Ltd., Coventry, England, have placed an anti-carburizing paint on the market for such purposes. Any spot which is required to remain soft is merely covered with this paint, which prevents the carbonizing of that particular place. No special preparation of the part is necessary except that the surface should be quite free from dirt or grease. The compound is applied to the article with an ordinary brush on such parts as are to remain unaffected by the casehardening. It is then allowed to dry, and the article packed in the case-hardening box in the usual way. When the hardening process is concluded the paint will be found to have fused to a glass-like substance, which can be removed by scraping or sandblast. Their Canadian office is at 1-3 Jarvis Street, Toronto.

Tests with glass insulators have been in progress in Switzerland for several years, and numbers of these insulators have been used in France and the United States for potentials up to 50,000 volts. The principal application for glass insulators is, however, up to 25,000 volts. Such failures as have occurred with glass insulators, says Practical Engineer, have been due principally to internal stresses which cause cracking when the insulator is subjected to heavy mechanical stress or sudden temperature change. The occurrence of such failures has been made less frequent by the use of improved material and better annealing. As for the puncture strength, it is higher than that of glazed hard porcelain. The glass used in Switzerland is clear and transparent, hence the absorption of solar heat is less than in the dark green glass hitherto employed.

## THE OLD TERM HORSEPOWER

What is a horsepower? Briefly, it is a rate of doing work. If you lift 550 pounds, one foot, in one second, you have actually completed a horsepower of work. Naturally, a horsepower is able to raise twice that weight one foot in twice the time, or one-half foot in just that time. Moreover, it can raise half 550 pounds one foot in half a second, or two feet in a second, and so on. Therefore, when we lift one-fourth of that weight, 137½ pounds, four feet in one second, we are exerting a horsepower.

This being granted here is what we get. If a person who weighs 137½ pounds runs upstairs at the rate of four feet a second, he is exerting the equivalent of a horsepower. For a man weighing twice that much, 275 pounds, it would be necessary to climb at the rate of only two feet a second to exert a horsepower. It is possible to do much more.

As a matter of fact, a horse often exerts many times a horsepower. The average horse can draw a wagon up a hill where a ten horsepower engine would fail. A horsepower does not represent the greatest momentary strength of the average horse, but is a measure of the power which he can exert continuously.

# DEVELOPMENTS IN SHOP EQUIPMENT

## RADIAL DRILL DRIVE

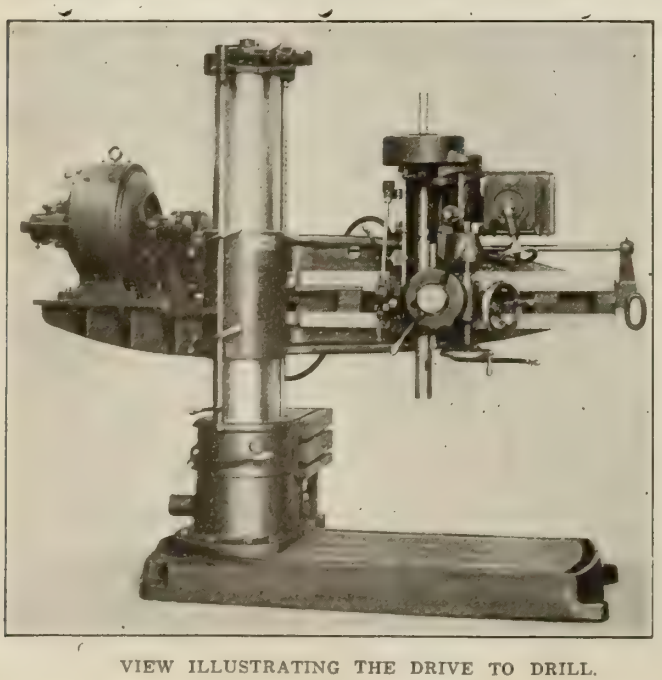
The Fosdick Machine Tool Co., Cincinnati, Ohio, have introduced a new drive for their radial drilling machines. The illustration depicts their 4-foot heavy-duty radial drilling machine equipped with a five horsepower R. & M. 3 to 1 variable speed motor. It will be noted that the motor is mounted on the radial arm. A Cutler Hammer controller is also located directly on the spindle head.

One advantage of this arrangement is the swing of power through the elimination of two sets of bevel gears. The motor is also away from the dirt that usually accumulates on the floor. The arm is partially balanced and additional floor space around the base is available.

The outstanding feature of this particular application is the standardization. By such a method any standard make or speed of 3 to 1 variable speed motor may be used, thus avoiding the usual delay caused by the necessity of special patterns and castings for each particular type. A bakelite pinion is placed on the motor shaft, this varying in size according to the speed of the motor selected. All other gears are kept standard.

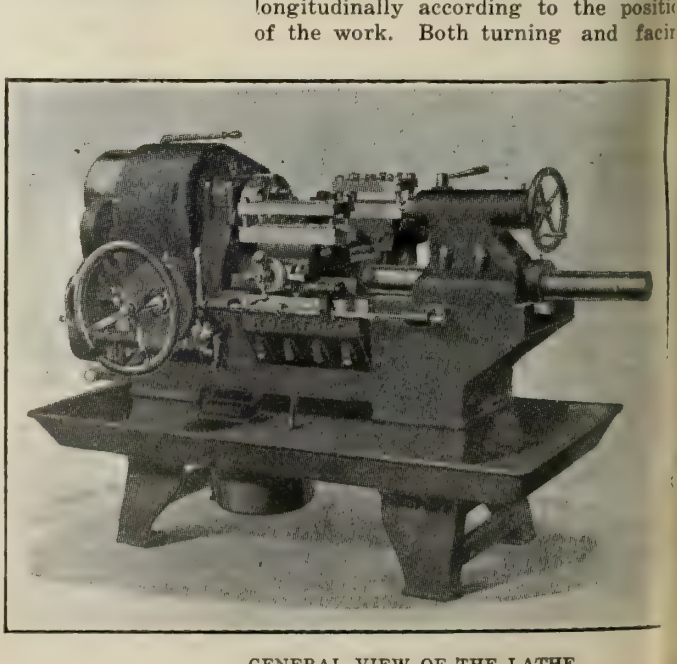
The fact that one motor only is used is regarded as a strong feature. The elevating mechanism drives from this motor through the regular standard gear arrangement. The controller, as seen mounted on the spindle head, is made more convenient of operation by the bevel gear connection to the handwheel below it. This type of control is preferred in shops where the work is usually on large castings where the spindle head is frequently at the upper and outer extreme.

A more popular location for the controller is on the arm girdle, convenient to the operator's left hand. This eliminates the large flexible conduit in the rear of the arm, and is the most satisfactory for the average run of work. This type of drive is furnished on the 4, 5 and 6-foot heavy-duty radials.



## ROCKFORD AUTOMATIC LATHE

The accompanying illustration shows an automatic lathe that has recently been added to the line of the Rockford Machine Tool Co., Rockford, Ill. The machine is intended for the rapid production of duplicate parts, especially for the turning of pistons, pulleys, cone pulleys and gear blanks where multiple tools can be used and the turning and facing operations done at the same time. It is built on the lines of a 22-inch heavy-duty lathe so as to insure absorption of vibration and to withstand the severest service.



The machine is provided with three changes of speed, operated by means of a gear-shift lever. The driving gears are of wide face and large pitch, the main drive being through helical gears, to give smooth running. The machine is driven by a single pulley of large diameter and wide face, the operating lever for controlling the starting and stopping of the machine by means of the clutch within the pulley being in easy reach of the operator. The machine has geared feed driven direct from the spindle through a train of spur gears, the lower two being slip gears so that variation of the rate of feed may be obtained.

The head stock is cast in one piece with the bed so that there is no chance for give of the head. The front, or turning carriage, is mounted on a 3½-inch bar, which has long bearings in both the headstock and the tailstock, the outer end of the carriage being supported on hardened steel way that can be shaped so as to give to the work taper, convex or concave form. Rack teeth are cut in the bar and mesh with the cross spindle of the machine for obtaining the feed. A worm and worm gear driven direct from the feed gears furnish power to the cross spindle, the worm being mounted in a drop frame so that the feed may be released at any predetermined position.

The back or facing head is mounted on a bracket on the back of the machine in alignment with the spindle and is held in place by a tongue and groove and four bolts. This facing head is adjustable longitudinally according to the position of the work. Both turning and facing

VIEW ILLUSTRATING THE DRIVE TO DRILL.

GENERAL VIEW OF THE LATHE.

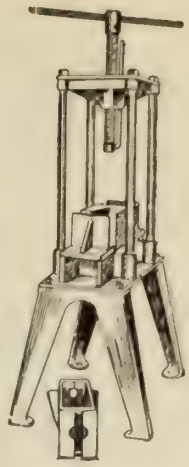
carriages are provided with suitable tool blocks so that any desired number of tools may be used at the same time. The power feed for the rear or facing head is obtained through a cam drum, driven from the cross spindle by rack and pinion, enabling both the turning and the facing heads to be controlled by the same stop, the time taken to finish any operation being the time of the longest cut. Any shaped cam may be mounted on the drum, making it possible to secure different feeds on the rear head than provided by the feed gears for the turning head. The tail stock is of the four-bolt type, and has a quick-acting spindle for releasing the center. It is provided with a rack and pinion for changing its position. The bed has an oil pan with reservoir for supplying cooling lubricant to the work, the pump being driven from the pulley shaft of the machine. The machine can be furnished arranged for direct motor drive. The motor is then mounted on a bracket and connected to the pulley shaft of the machine through spur gears, a large clutch gear being used in place of the clutch pulley used for belt drive. Following are the principal specifications:

Swing over side carriage bar 14 inches, swing over cross carriage 10¼ inches, maximum distance between centers 18 inches, travel of side carriage 12 inches, front spindle bearing 4⅝ x 6⅜ inches long, rear spindle bearing 3½ x 4⅞ inches long, hole through spindle 1¼ inches, taper hole in spindle No. 5, diameter spindle nose 3⅝ inches, length spindle nose 2⅝ inches, threads per inch 5 U.S., tailstock spindle diameter 2⅞ inches, diameter drive pulley 14 inches, width of drive belt 6 inches, weight 3,500 pounds.

## ROTARY EMBOSSING MACHINE

A rotary embossing machine has been placed on the market by Julius Merey, Chicago, Ill. The machine is intended to emboss legends especially on tubular objects, such as cans and similar containers. It does embossing on flat objects.

The main frame of this machine is made from cast iron, wherein four large cast iron boxes with phosphor bronze bushings are housed. The two lower ones are stationary, while the upper ones are fitted for up and down movements. Two large embossing shafts are fitted into above bearings.



The machine has a lock device to keep embossing shafts closed while embossing is in progress, and has also an automatic stop. The embossing dies, male and female, are made of segments, which are interchangeable, and provide for setting out any names, etc.

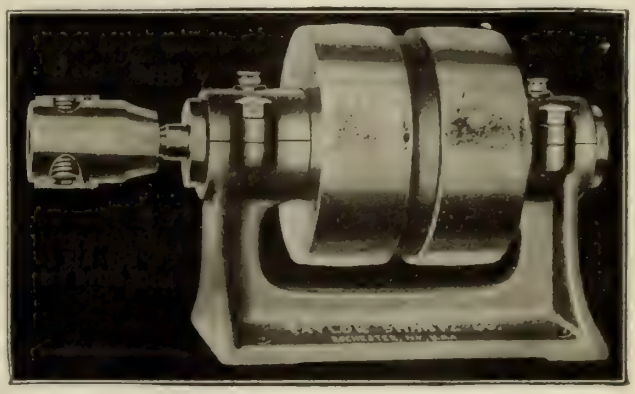
The smaller frame is intended to hold objects by means of chuck, and has a longitudinal and vertical movement subject to various dimensions of objects, and connected from main frame by means of spur gears. At the end of the connecting main shaft is an adjustable friction plate, this permitting objects for various diameter dimensions to follow the arcs of the embossing die segments. The machine weighs about 2,000 lbs., and has a capacity for three rows of embossing at the same time on 16 gauge steel or lighter. Power required, 3 h.p.

## BENCH TAPPING MACHINE

The Taylor-Shantz Co., Rochester, N.Y., have placed on the market a bench tapping machine as shown in the illustration. The machine is used in tapping threads of all sizes up to and including 5-16-inch diameter. The tap is driven in the required direction for tapping as soon as the work is pressed against it. It is also automatically reversed when the work is pulled away.

A leather faced disc is used between the pulleys, this minimizing the danger of tap breakage. The machine can be driven from the lineshaft with one straight and one cross belt. The bed of machine is 7⅝ inches, and the pulleys are 5 inches diameter by 1½ inches face. The weight of the machine complete is 21 pounds.

GENERAL VIEW OF THE ARBOR PRESS.



ments, such as sliding L-blocks, etc., are used in conjunction with the press where necessary.

## ROTARY WIRE BRUSH

The Independent Pneumatic Tool Company, Chicago, Ill., have placed on the market a special rotary wire brush for use on their No. 71 portable pneumatic grinder and No. 6 electric grinder. In reality the brush attachment makes two tools in one. The grinder can be used with emery wheel, and with very few changes the brush attachment can be added. The brush, which is attached to the No. 6 electric grinder, is smaller, because of a higher number of revolutions per minute and requires a few attachments not necessary on the grinder.

The wires in the brush are of equal length, interchangeable, and are made of specially treated steel. The concave wood back, which, in turn, is fitted inside a metal cover, secures the brushes in position, which also permits of tapered ends or working surface allowing the wires to bend under pressure without breaking.

These brushes are said to be particularly useful for removing paint, rust, scale, grit, dirt, sand; also for cleaning steel cars, automobile bodies, steel frames, tank cars, foundry castings, and sheet metal of all kinds.

GENERAL VIEW OF THE TAPPING MACHINE.

## ARBOR PRESS

The R. S. Whitney Co., Lewiston, Me., have placed on the market an arbor press as illustrated. These presses are said to be light in weight, and compact in construction. Both the head and base of press are webbed to supply strength and withstand strains.

The base is provided with ways like a lathe, this permitting the blocks to slide into various positions. A large recess through the base is provided to allow the passage of shafts, gears, etc.

The screw of press has a square thread, the head being supplied with recesses allowing the use of two bars when exceptionally heavy pressure is necessary. The press has a patented feature that consists of a single rod sliding parallel with the screw and attached to a cap on the pressure end of the screw. This prevents twisting strains on the surface of the works. The press is made in two sizes, namely, 30-ton and 50-ton, and various attach-

# Have You Tried This Contest Yet? If not--- Do so Now

Below will be found twelve references to advertisements in this number. To the sender of the first correct set of answers to these we will forward one of these scales.
To win one is not difficult, and at the same time you will add to your store of knowledge. Read the details given below.

The scale is 6 in. long and is made from finest quality steel. One side is marked in 32nds, the other side in 64ths. A table of decimal equivalents is also stamped on one side, and a table of tap drill sizes on the reverse side. This scale is well worth securing.

## What You Have to Do

We publish every week a number of interesting facts or statements selected from the advertising pages for that week. The selections for this issue are given below. Read these through, then turn to the advertising section and see if you can pick out the advertisements to which they refer. The work is interesting, it will train your powers of perception and of memory, it costs you nothing, it will make you better acquainted with the various lines of machinery and tools in the market, and with perseverance you are bound to win one of these useful scales as a prize.

The winner for February 17th issue is Charles E. Mars, Brantford. There is quite a story connected with this contestant. He forwarded a list of answers, thought better of it and sent us another list, requesting that we destroy the first one. His persistence counted, for his second list was correct. It's the old story of "If at first you don't succeed, try again." Readers who have tried and failed to land on top will no doubt get added pep from this little story.

**CONTEST FOR MARCH 10TH ISSUE**

**Contestants are required to write us, stating to which advertisements we refer in this number.**

1—Something in a machine that ensures proper lubrication.
2—How to secure expert advice on a certain kind of problem.
3—How to save money.
4—A reasonable request.
5—Something claimed to have accuracy and a wide range of service.
6—How to keep your shop clean.
7—How to get high cutting and high return speeds on a certain type of machine.
8—Something that is said to be free from vibration.
9—How to boost your production.
10—Something that costs less for upkeep.
11—A product that has four heads, yet no eyes in any of them.
12—That you can reverse a part of a certain product and use it with equal success.

**These are Correct Answers for List from February 17th Issue:**

1—Morse Chain Co.
2—Oliver Machinery Co.
3—L. S. Starrett Co.
4—The Hull Iron & Steel Foundries.
5—United States Electrical Tool Co.
6—Garlock-Walker Machine Co.
7—E. C. Atkins & Co.
8—Dunbar Brothers.
9—Algoma Steel Corporation.
10—The Walton Co.
11—Tallman Brass & Metal, Ltd.
12—Katie Foundry.

## Closing Date for This Contest is March 24th.

# Proper Safeguarding of Machine Tools in General

## Use of Cast Iron as Suitable Material for Safeguarding—Forms and Types of Guards—The Danger of Projections—Flywheels—Revolving Cutting Tools and Sliding Parts.

By G. STEVENSON TAYLOR, O.B.E.

THE subject of properly safeguarding machine tools is at all times an interesting study, and in a recent paper by Mr. G. Stevenson Taylor some interesting and valuable points were brought out. This paper was presented at the Industrial Safety Conference in England and the following points abstracted from the talk should prove of decided interest to our readers:

In safeguarding the ordinary parts of machines the following are regarded as the essentials of a satisfactory safeguard: (1) It should prevent access to the dangerous part so long as the danger exists; (2) it should be constructed of such materials and in such a manner as to withstand the wear and tear to which it is likely to be subjected; (3) wherever practicable it should form an integral part of the machine and have been considered in its design; (4) it should, where necessary for intermittent dangers, be automatic in action; (5) its removal should not be necessary for the purpose of lubricating parts of the machine or the material under operation, or for changing belts, gears, etc.; (6) it should not introduce any fresh risk of accident; (7) it should be so hinged or hung as to be easily opened or removed when frequent adjustments and alterations are necessary, but in such cases should not be easily removable from the immediate neighborhood of the machine; (8) it should not interfere unduly with the output of the machine.

The selection of a suitable material for the construction of safeguards is a matter of utmost importance, but, unfortunately, often receives very scant attention from machine users, and sometimes from machine makers. Wood, cast iron, sheet metal; rods, tubes, and bars of metal; wire work and all expanding metal, millboard, and papier-mache, may all be utilized, and may all prove satisfactory under particular circumstances. When substantially and firmly constructed of sound timber, wooden guards for such parts of machinery as pulleys, belts, small fly-wheels, and shafting, can be both neat and effective. The use of wood for guards has, however, many disadvantages; it is easily splintered and broken, readily absorbs liquids, and increases the fire risk.

### Use of Cast Iron

Cast iron is a particularly suitable material for the safeguarding of many dangerous parts of machinery. Guards of this material can be designed so as to form an integral part of the machine and to meet all other conditions which have been laid down. One objection often raised against cast-iron guards is that the gears or parts covered cannot be readily seen or oiled. Generally the guards can be removed at intervals to make an examination, and if there is any special danger of keys or screws working loose inside the guards, small sight holes with loose covers can always be arranged in them. Lubrication with the guard in place can nearly always be arranged, and in many cases the cast-iron guard will serve as an oil bath.

### POINTS BROUGHT OUT

First—The guard should protect the dangerous part as long as the danger exists.

It should be constructed of proper material to withstand wear and tear.

It should form an integral part of machine if at all possible, and should be embodied in the design.

Should the danger be intermittent, the guard should be automatic in action.

Guards should be so constructed that oiling can be accomplished without their removal.

Above all, the guard should help rather than hinder the output of the machine.

Sheet metal, especially sheet steel of suitable gauge, is an excellent material for guards. Simple forms of guards can be easily and cheaply produced by stamping when required in sufficient numbers, and can be made to conform to all the conditions which have been laid down for a satisfactory guard.

Rods, tubes, and bars of metal are suitable for some classes of safeguards, especially those which are effective at a distance of 18 in. from the part of machinery guarded. Unless this is the case these materials should not be used except with small spacing, or in conjunction with sheet metal, wire work, or expanded metal.

Wirework and expanded metal are similar materials for guard construction, except that expanded metal often has a somewhat sharp edge which may cause cuts and may also render it unsuitable for guards where delicate or fibrous materials are dealt with. Such guards, however, are likely to be deformed by rough usage, they do not exclude grit or dust from the parts covered, and they are difficult to clean, especially where fibrous dusts are produced or adhesive materials handled.

Millboard, papier-mache, and similar materials have only been used in the construction of some patented types of safeguards for revolving shafting. Where, as on overhead shafting, they are not subjected to rough usage, such safeguards have proved effective and durable.

The following are the principal accident-producing parts of machinery, or machines in engineering works: (1) Plain shafting, spindles, etc., bars and rods in automatic lathes; (2) projections, such as set-screws, studs, bolts, key-heads on collars, couplings, clutches, pulleys, etc., lathe carriers, drivers and jaws of chucks; (3) fly-wheels, armed pulleys and wheels; (4) driving belts, ropes and chains; (5) spur and friction gearing; (6) revolving cutting tools; (7) grindstones and abrasive wheels (bursts); (8) sliding and reciprocating parts, including plungers of presses, punches, etc.; (9) hoists and lifting appliances, cranes, etc. This list is not exhaustive, but it shows the principal sources of machinery accidents where safeguards can be adopted with advantage.

### Forms and Types of Safeguards

All shafting within 6½ ft. of the floor, or within this distance of any place where persons have access whilst the shafting is in motion, should be efficiently safeguarded. It is not possible to guard the whole of the exposed parts of drill spindles, but additional protection could be fitted with advantage in many cases. Accidents due to clothing being caught by twist and other drills can only be prevented when a satisfactory drill holder is devised which will allow the drill to run free except when pressed on the work. The safeguarding of the shafts and universal couplings of milling machines is more difficult than that of ordinary shafting, as the shaft varies in both length and direction. Two telescopic lengths of tube with gimbal fittings at each end will generally meet the difficulty. Some machine-tool makers have fitted cast-iron covers over the universal joints, but have left the shafts exposed; others have fitted an open coil of wire over both joint and shaft, but this is only a partial guard and does not prevent a loose end of clothing from getting on to the joint or shaft. As in the case of lineshafting, the best form of guard consists of a tube or tubes completely enclosing the bar. The tubes can

be carried on standards and adjusted to the length of the bar.

### Projections

The risk of serious accident from revolving plain shafting, spindles, etc., is considerably enhanced if they carry collars, couplings, clutches, pulleys with any projecting parts, such as set-screws, key-heads, etc. All set-screws in collars and other revolving parts of machinery and machine tools should be recessed below the surface of the revolving part; and there is no reason why this simple precaution should not be taken on all new machinery. Where this is not practicable on existing machinery the projecting screws should be properly covered with suitable sheet or cast-metal casings.

### Flywheels

For safeguarding fly-wheels, etc., standard and rail fencing may be satisfactory if double or treble rails are used and placed not less than 18 in. from the moving parts, the top rail being not less than 4 ft. from the floor, and if there is a covering of sheet metal or wire work, either from the floor to the bottom rail or extending at least 6 in. above the floor to prevent tools, etc., falling under the rail.

If it is necessary to carry the fencing closer to the fly-wheel or pulley—and, on the whole, close fencing is the more satisfactory—then the guard should extend to a height of 6 ft. 6 in., or to the top of the pulley or fly-wheel if less than this. The guard should consist of sheet-metal, wirework or other close material on a suitable frame. Fly-wheels and pulleys should be fenced on both sides as described if they have to be approached for any reason. The fly-wheel of a gas or oil engine is often well guarded on the outside, but on the crank side, where it is constantly approached by the attendant when feeling the bearings, it is frequently left quite unguarded.

The parts of overhead pulleys which are within reach of workers—i.e., less than 6 ft. 6 in. from the standing place—should be safeguarded underneath by strong sheet-metal or other guards.

### Driving Belts—Ropes and Chains

Accidents from belts mainly arise (1) by trapping at the intake of belt and pulley, (2) by persons being caught by loose belts hanging on shafting, (3) by belt or belt fasteners striking a person, (4) from fracture of belt. Accidents from rope and chain drives arise chiefly from causes (1) and (4). Where a pulley is suitably guarded the intake of the belt will also be guarded. Many accidents at belt intakes are caused by persons removing, replacing, or shifting belts by hand. The danger in connection with the first two operations can be largely eliminated by the use of fast and loose pulleys and proper striking gear, also by the use of proper belt poles or mechanical belt shippers. A belt should never be allowed to rest on a revolving shaft, owing to its liability to seize on the shaft and wind up, involving either accident to the person who may be touching the belt, or injury to the machine with which it is associated. Belt perches, hooks, or hangers should be provided for loose belts, unless they can rest upon the guard provided for the shafting.

Driving chains are now largely used in connection with motor and other drives for machine tools. They should always be completely enclosed by either cast-iron or sheet-metal guards. The majority of machine-tool makers have embodied some excellent guards for chain drives in the design of their machines. The guards not only form an oilbath, but also a dustproof casing for the chain and sprocket wheels.

### Revolving Cutting Tools

Milling machines are the principal machine tools with revolving cutters which give rise to accidents in engineering shops. The majority of accidents occur on the narrow circular-saw type of cutter, but also to some extent on other types. They are generally due to the worker's fingers or hand or arm coming into contact with the cutter whilst reaching over the revolving cutter or whilst gauging his work. Guards for milling cutters should (1) prevent contact with the cutter, (2) be readily adjustable, (3) not interfere with a view of the work, (4) not prevent proper lubrication of the work. Several guards have been patented which comply with these requirements, and some in addition facilitate proper lubrication of the work.

### Sliding and Reciprocating Parts

Accidents are caused either by crushes between the moving parts and some fixed structure, or, in the case of quick-moving parts like the tailrod of an engine, by a direct blow. Such parts as the latter can be readily safeguarded by being enclosed in a metal tube or covered with an inverted trough of sheet metal. Planing and similar machines with sliding parts should be fixed in the shop so that the part cannot run within 18 in. of any wall or other fixed structure, nor should it traverse any alleyway or the space in front of any doorway. The beds of planing machines should be filled in with perforated sheet metal or similar material, as accidents have occurred through men either slipping into the bed or attempting to obtain tools stored therein (a dangerous practice) whilst the machine was in motion.

Accidents due to crushing of hand or fingers by the plunger on power presses of various kinds form an appreciable percentage of the total machinery accidents. The essential feature of a satisfactory guard for the plunger of a power press is that it should prevent the hand or fingers of the operator being under the plunger when the latter descends, whether its motion is due to the proper use of the controlling mechanism or to "repeating." It may be noted that the use of a double-handed control on presses does not obviate accidents due to "repeat" strokes. For straight blanking on small work and other simple operations, fixed guards are quite effective. They may be made of sheet metal, rods, or wire work, and should surround the plunger, merely leaving a narrow slot through which the sheet can be inserted. Guards of varying sizes must be used with the different sizes of guides.

## The Use of Milling Machines

THE development of the miller as a manufacturing tool has been nothing short of marvellous within the past few years. There was a time when a milling machine was looked upon as a tool-room proposition—and a very risky one at that. This condition, however, is past and gone, and at the present time there is hardly a plant of any proportions that cannot boast of its miller equipment.

In fact in the larger manufacturing plants they have their milling machine department. Row upon row stand these accurate producers. Small, medium, and large, they each accomplish the work best suited to them. The manufacturing miller of to-day is a more rugged machine tool than formerly. It is built to stand the gaff, to use a common expression.

Operations are now performed on this type of machine that were deemed impossible before. Take for example the problem of cutting the worm shown at Fig. 10 in the first article of the present issue. Here is a job that would have puzzled the old boys of the early school, but nowadays a little problem like this is of no account. By building a special attachment to operate in conjunction with the regular machine the difficulty is overcome.

This brings out very forcibly the need of proper fixtures to be used as an aid to the machine itself. To obtain production we must have jigs that are as fool proof as possible. No machine can do its best work unless aided by fixtures of some nature or other.

Time occupied in the studying of the problems shown in this first article will be time well spent, for it may throw light on the very problem you have been concentrating on for some time past.

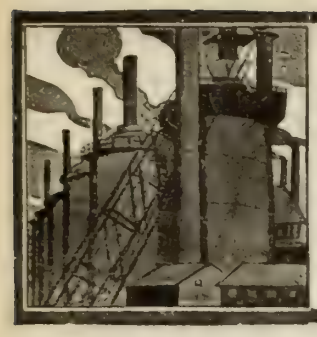
## Protecting the Fireman

IN a recent issue of a journal which specializes in technical subjects arranged for the understanding of the layman, there appeared recently an article of interest to the engineering profession.

From this it appeared that the man who is engaged in the task of generating steam in the boiler by shovelling coal is frequently inconvenienced by the heat. This is something we have noticed ourselves, but it is nice to have it confirmed by such an authority. We must confess, however, that the way to avoid this inconvenience had not previously suggested itself to us. This is all the more remarkable as it appears so simple. All that is required is to make the furnace doors and fronts hollow, and through the passage thus formed circulate cool and refreshing water. The author goes further, and says this system can be applied to other parts of the boiler. Why of course it can! When we come to think of it there are lots of places it could be applied. For instance, imagine what a delightful place the boiler room would become were the shells of the boilers jacketed before the lagging was put on. The steam pipes could be run through a larger pipe, with circulating water in the space between. There would be all kinds of comfort in the boiler and engine room then.

However, we always had the idea that all the heat possible should be retained in the boiler and steam pipes. The method of keeping boiler furnace doors cool always seemed to us to be by keeping the fire clear of the dead plate, as we always found that burning coal on the dead plate didn't help the generation of steam greatly. On the other hand, it was good for the manufacturer of arch bricks, furnace door baffle plates, etc.

Again we must confess, however, that the simple idea of a water jacket never entered our head.



## It Crops Up Again

SOMETIMES we think the type of inventor who believes he can get more out of a machine than he puts in has died out. Then suddenly our hopes are shattered, and from out of the void comes a voice crying "Eureka! I have found it." Needless to say the owner of the voice only thinks he has found it. It isn't there to find.

A gentleman by the name of H. Nicolaides is the latest to spring the old story. He has a machine, or principle by which he claims he can do roughly 173,000 foot-pounds of work in an air cylinder by the expenditure of 60,000 foot-pounds in the steam cylinder. The method he proposes is somewhat involved, and requires careful reading before his idea is grasped. However, we still believe that Baylis Law holds good, our inventor to the contrary notwithstanding. He traces back the prophecy of his invention through the shades of Greek mythology, leading up to a vision which was vouchsafed to him, which started him to thinking deeply.

This inventor is generous. He wants no reward but renounces his claims freely to the government and the people. He wishes the government to proceed gradually with the manufacture, as he does not wish existing industry to be shattered at one fell swoop. He is quite ready to appear before a body of scientists and engineers, and if he does not convince them, will voluntarily retire to an asylum. That would seem to us to be a wise step.

The machine has never yet been built by man which is 100 per cent. efficient, let alone over 100 per cent. We doubt very much that it ever will. The fundamental principle that you cannot get more out of a machine than you put in remains as immutable as ever. If ever that condition should be changed, then indeed would this world, in the words of Mr. Nicolaides: "Be transformed from a vale of tears to a veritable Paradise."

# MARKET DEVELOPMENTS

# Reduction in Price of Steel, Will it Come Soon?

## Interest Centers on This Possibility—Machine Tool Enquiries Are Much Larger—Scrap Market Still Dull, But in All Phases of the Market Good Times are Looked For

"GOOD times are ahead." Machine tool dealers feel sure on this point and expect that the enquiries they have been receiving will lead to actual business. American concerns locating in Canada are taking advantage of the exchange rate and are purchasing everything possible in Canada, as by so doing they get better value for their money.

Many stories are rife regarding the U.S. Steel Corporation. One report states that a decline is looked for hourly, but whether this is so or not remains to be seen. Many large agricultural implement makers have taken on stocks at present prices and should a sudden drop take place these interests would be seriously involved.

Trading in the steel industry is extremely light at some points, the customer in many cases ordering only sufficient material to carry him over. In fact in some quarters business is confined almost entirely to repair work. Hope is expressed that next month will see a decided improvement.

The scrap metal market remains dull. Some dealers are said to be losing money every day and in some quarters manufacturers are storing their scrap in the yards until prices are better. One dealer states that prices will advance when conditions reach normal.

Ontario holds the spotlight this week, there being more actual buying in this province than in any other. The labor situation in United States demands attention, also the steel and freight problem.

Independents are not operating at more than 20 to 25 per cent. of capacity, while the corporation have dropped to about 60 per cent. against 90 per cent. in last January. Pig iron is also less than 50 per cent. of its actual productive capacity.

## BUSINESS AT PRESENT CONFINED ALMOST ENTIRELY TO REPAIR WORK

Special to CANADIAN MACHINERY.

MONTREAL, Que., March 7.—Spring weather has had a cheering effect upon many individuals, but business has not, as yet, responded to the encouraging rays of a warmer sun. Merchants and dealers still report more than a seasonable dullness; as a matter of fact, past years have generally experienced a noticeable revival of trade at this period of the year, but there is little evidence that improvement in any direction has yet taken place, although many statements seem to prove the contrary. A representative of a large Montreal house, recently returned from a business trip to the States, told Canadian Machinery that many industrial centres across the line were gradually returning to more normal conditions and that operations in many of the metal trades were showing gradual but steady increase. Local dealers are still awaiting the time when they can truthfully say that business has improved. Occasionally an order comes through that leads one to believe that the tide has turned, but it proves to be only a wave slightly larger than the usual ripple. There is no particular business where activity is pronounced, as quietness in all directions is still more or less general.

### Repair Business Only

The steel situation has little to offer of special interest. Trading is carried on in a quiet way with a steady but light business done in warehouse supplies. Few tonnage orders are placed now, the requirements being for one or more plates, shapes, bars or tubes, for special purposes. Little attempt is made, on the part of the consumer, to secure more than he actually needs for the work in hand, and in many cases the dealer has quit urging the purchase of other materials, generally leaving everything in the hands of the user. Little has transpired during the past week to change the general tone of the market here, and dealers show no inclination to pass on possible developments. "Business at present," said one dealer, "is confined almost entirely to repair work, where one or two plates, a few bars or tubes, are sufficient to make the repair, and it is seldom that we see a big order. Of course, it is the time of year when demand is never very brisk and we live on in the hope that the coming months will be a little brighter."

### Metals Lower and Movement Light

The movement of non-ferrous metals continues light as consumers are still buying conservatively. Rock bottom prices do not appear to affect the market, and the buyer is not awakened even when quotations decline sharply. One satisfactory feature of the day is that manufacturers are not carrying stocks of any kind, for the stated reason that they desire to be in a position to take advantage of the lowest price. This would be all right if one could be assured of what was the lowest price. The depleted state of stock supplies in the average plant to-day means that a return to normal market would likewise mean a return of a demand, which at first would be greater than normal, the consequence being a strengthening of prices. An alternative to this possible condition would be to cover, in part, future requirements from existing supplies, to avoid excessive demand for material should business suddenly revive. "Speaking of

a waning market," remarked a dealer here, "there is little to wane, as prices on non-ferrous ingots and semi-finished materials are as low as they can possibly go.

"We may see slightly lower quotations, but with the present cost of production as a basis, a lower market would mean considerable loss to the seller of the commodity. What the trade should do now is to buy carefully, even for the future, but buy, as it is only in this way that normal business can be revived." A further slight decline has developed in ingot metals, coppers declining ½ cent per lb., tin, on a 2-cent drop, is quoted at 37 cents, and lead is off ¼ cent per lb. at 6½ cents. Spelter, antimony and aluminum hold firm at previous quotations. Copper products have likewise declined, the reduction being $2.00 per hundred pounds. Copper bars, ½ to 2 inch, are now quoted at 30 cents per lb. Tinned copper sheets, 14 oz., are quoted at 38 cents, and plain sheets at 32 cents per lb. Lead sheets now range from 9 to 9½ cents per lb. Demand in all cases is light.

### Non-Ferrous Scraps Decline

There is little doubt that many old material dealers are losing money at the present time, and stand to lose considerably more if the present dull condition continues. Some dealers are carrying stocks that cost them much more to lay in than they could buy the stuff for just now. They are in hopes, however, that the spring and summer activity may be sufficient to establish a better market in scrap and that prices on many lines will advance to higher levels, enough to prevent any heavy run on stocks now held. One feature of the old metal situation is the comparatively low overhead necessary, but even in the scrap business it is not always good policy to break up the organization, as experience in the handling of old materials is often as essential as in other lines of activity. Apart from a further decline on prices quoted the market holds little of interest to the dealers, as consumers are not buying except to cover urgent needs, and these are exceptionally light.

Non-ferrous metals show a dullness that is reflected in lower price quotations. Coppers are down from one to one and a half cents, light copper being quoted at 9½ cents per lb. No. 1 machine composition has declined 3 cents, the price quoted now being 10 cents per lb. Brass scraps are also weaker. Zinc is now 4 cents and tea lead 2 cents per lb. Aluminum has dropped from 15 to 12 cents per lb. Iron and steel scraps are holding firm on light movement, the only change being on cast borings, dealers quoting $5.00 and under. Despite the declining prices no revival is apparent.

## POINTS IN WEEK'S MARKETING NOTES

**Surface developments in the iron and steel market are of no importance, but important things are working out under the surface.**

—

**Independents are not operating at over 20 to 25 per cent. of capacity. Steel Corporation's operations have dropped to about 60 per cent., against 90 per cent. early in January. Steel industry as a whole is operating at about 40 per cent. capacity.**

—

**Pig iron production is a little less than 50 per cent. of actual productive capacity. Prices for steel products have declined very little.**

—

**Wire nails have formed the most interesting price decline of the week. One company claims the reduction was made because two other producers were quietly doing so, although nominally quoting a higher price.**

—

**Pig iron prices in New England have shown a tendency toward a lower level during the week. Prices in castings have softened.**

—

**The scrap market is slightly weaker, although no change is registered in price. Where scrap is available, offers are so out of line with the ideas of the producers that the latter hold scrap in their yards for a rise in price.**

—

**Small tool dealers report that more inquiries are coming in, but that this is as far as it goes. Rebuilt tools are favorites at present. Improvement is looked for from now on.**

—

**There is a feeling that prices in steel will drop shortly. In fact, one dealer states he expects it hourly—"A substantial cut is what I expect," to use his own words.**

## GOOD BUSINESS LOOKED FOR IN NEAR FUTURE
